From 1453 onwards (the third phase of the reign) the rivalry became increasingly acute—York acting as Protector of the Realm when the king was quite mad, the queen's party regaining the ascendancy when he recovered. The coming War of the Roses was foreshadowed in the battle of St. Albans, May 22, 1455, which was followed by a temporary reconciliation; but in 1459 open war broke out. York, after a victory at Northampton where Henry was taken prisoner, July 10, 1460, claimed the crown for himself in virtue of his descent from the elder brother of John of Gaunt; but he accepted a compromise, by which the crown was left to Henry during his life, but York, instead of the prince of Wales, was recognized as his heir.

York was killed at Wakefield, Dec. 30, 1460. His son Edward seized the crown with the aid of the earl of Warwick, and crushed the Lancastrians at Towton, March 29, 1461, from which year dates the reign of Edward IV. Meanwhile Henry had escaped from his captors and found refuge in Scotland. In 1465 he was caught again and imprisoned in the Tower. In 1470 Warwick revolted against Edward, drove him out of the country, and again set Henry on the throne. But in 1471 Edward returned, finally crushed the Lancastrians at Barnet, April 14, and Tewkesbury, May 4, where the prince of Wales was killed, and secured his throne when Henry was secretly put to death, May 21.

Henry was the gentlest and most pious of men, and most earnest in the spread of education. To him England owes many educational foundations, notably Eton and King's College, Cambridge. *Consult Religious Life of Henry VI, F. A. Gasquet, 1923.*

Henry VII (1457-1509). King of England. Henry Tudor, earl of Richmond, born at Pembroke

Henry VII,
King of England

Castle, Jan. 28, 1457, claimed the throne as representing the House of Lancaster through the Beauforts, legitimated descendants of John of Gaunt, father of Henry IV. He overthrew and slew Richard III at the battle of Bosworth, Aug. 22, 1485, was formally recognized by parliament as the legitimate king, and secured the position of his posterity by marrying Elizabeth of York, the eldest daughter of Edward IV, whose brothers had been murdered by the last king.

The young earl of Warwick, the male representative of the Yorkist line, was shut up in the Tower. Lambert Simnel, a pretender who personated Warwick, was made the figurehead of a Yorkist revolt which was easily crushed. A more dangerous pretender was Perkin Warbeck, who claimed to be the younger of the two princes murdered in the Tower by Richard III. He was finally captured in 1497, and both he and Warwick were executed in 1499.

Henry's great task was the re-establishment in England of a strong government in the control of the crown. To this end the first necessity was to destroy the power of the remnant of the nobles left by the War of the Roses. This Henry effected by heavy fines and confiscations which filled the royal treasury and helped him, after 1499, to dispense with parliaments which until then he had summoned frequently. The laws forbidding the nobles to maintain retainers were strictly enforced.

Henry avoided foreign wars, relying upon diplomatic action and alliance with the rising power of Spain as a check upon France. Partly in order to raise the middle class as a counterpoise to the nobles Henry directed his policy to the expansion of commerce, though he used its restriction as a weapon against adversaries on the Continent. He also patronised explorers and artists. He died at Richmond, April 21, 1509. *Consult Lives, J. Gairdner, 1889; C. Williams, 1937.*

Henry VIII (1491-1547). King of England. This second son of Henry VII, born at Greenwich, June 28, 1491, succeeded his father April 21, 1509, his brother Arthur having died in 1502. Having ob-

tained a papal dispensation, he married his brother's widow, Catherine of Aragon. His reign falls into two definite periods, the first, that of Wolsey's ascendancy, ending in 1529. The second is marked by the complete establishment of the royal supremacy, in which Henry's principal agent was Thomas Cromwell.

The young king was inveigled into a war with France by Ferdinand of Spain and the emperor Maximilian, but the war came to nothing. In the course of it a Scottish invasion was crushed at the great battle of Flodden, Sept. 9, 1513. Henry found in Wolsey a minister to whom he could safely entrust the control of state affairs; though the king's own will was always supreme. The cardinal sought to make England the arbiter between the two powerful young European monarchs, Francis I and Charles V; but it was probably against Wolsey's will that England in 1522 sided with Charles

Henry VIII
After Holbein

in his war with Francis, playing therein no very effective part.

Wolsey's fall was brought about by Henry's determination to marry Anne Boleyn, and for that purpose to procure the nullification of his marriage with Catherine of Aragon. In 1529 Wolsey failed to procure the papal sanction for the divorce, and was in consequence dismissed, with rank ingratitude for his faithful service. His policy of holding the balance between Charles and Francis fell into abeyance; Henry subordinated all else to coercing the pope.

Supported by the parliament, which he summoned with that end in view, and probably guided by Cromwell in the methods he adopted, Henry compelled the clergy to acknowledge him as supreme head

of the Church in England; ended once for all the payments made to the papal treasury; and finally repudiated the ecclesiastical authority of the pope in England. In defiance of the pope, the English ecclesiastical courts pronounced the marriage with Catherine void.

The next step was the suppression of the monasteries; the smaller houses were dissolved on the score of immorality in 1536, and the larger in 1539, partly on the same charge and partly on that of treason. Henry, however, permitted no departure from the recognized doctrines of the Church beyond distinguishing between practices which were essential and those enforced as "convenient." A Catholic insurrection in the north called the Pilgrimage of Grace, in 1536, was mercilessly and treacherously suppressed. The royal authority was secured by the Treasons Act, 1534, and the Royal Proclamations Act in 1539. Henry was always careful to obtain every increase of royal power, and sanction for all legislation, from parliament itself.

With the same cynical ingratitude which had flung Wolsey aside, he sent Cromwell to his doom in 1540. The last years of the reign were marked by a desultory war with France; the crushing of an invading Scots army at Solway Moss in 1542; and attention to the navy.

Henry married six times. The marriage with Catherine of Aragon was annulled; Anne Boleyn was executed on charges of treasonable infidelity; Jane Seymour died giving birth to the future Edward VI; the marriage to Anne of Cleves was pronounced void within weeks of its celebration; Catherine Howard suffered the same fate, on the same charge, as Anne Boleyn; but Catherine Parr survived her husband, who died Jan. 28, 1547. Henry was a more than ordinary scholar and musician.

Bibliography. History of England, 1856-70, J. A. Froude; Reign of Henry VIII, J. S. Brewer, 1884; Henry VIII and the English Monasteries, F. A. Gasquet, 1899; Lives, A. F. Pollard, 1905; F. Hackett, 1929; Helen Simpson, 1934; Private Character of Henry VIII, F. Chamberlin, 1932.

Henry I, CALLED THE FOWLER (c. 876-936). German king. Son of a duke of Saxony, Henry succeeded him in 912, and both before and after his accession did much to protect his land from

various invaders. His fame as a warrior spread far, and in 919, after Conrad's death, he was chosen German king. His reign was full of wars, for many princes refused to submit to him, and he quarrelled with the king of France over Lorraine; but to Saxony he was a great benefactor, not unlike Alfred in England. He trained and organized an army to defend the country, had walls built around the towns, and in other ways made the duchy more secure and prosperous, also enlarging his territory by wars with his neighbours. Henry died July 2, 936, and was succeeded by his son, Otto the Great.

Henry II (973-1024). German king and Roman emperor. Born May 6, 973, a descendant of Henry the Fowler, and son of the duke of Bavaria, in 995 he succeeded to the dukedom, and in 1002, when Otto III died without sons, induced the German notables to choose him as their ruler. He had some trouble with other claimants, but he managed to hold his own, and spent the next few years in Italy, in warfare with the Poles and in crushing a series of rebellions. In 1014, there being then a lull in this strife, Henry was crowned emperor at Rome, and the concluding years of his reign were passed in an attempt to add Burgundy, then a separate kingdom, to his lands, and in fighting the Greeks in Italy, where he was the pope's ally. He died July 13, 1024. Henry, who was known as the Saint, was keenly interested in ecclesiastical matters, being one of those who wished to see the Church reformed. He was canonized in 1146.

Henry III (1017-1056). German king and Roman emperor. Son of the emperor Conrad II, he was born Oct. 28, 1017. To secure his future position Conrad had him crowned king when he was only ten years old, and in a few years he began to take an active part in imperial affairs. He succeeded to the throne in 1039, no rivals appearing to dispute his inheritance, and his reign of seventeen years was almost free from that internal strife which disturbed the time of his father and his son. On the frontiers, however, Henry had full occupation. The Bohemians and the Hungarians were most troublesome; so on the other side were Burgundy and Lorraine. These risings, however, were all crushed, and having settled a dispute between three rivals for the papacy by appointing Clement II, Henry was crowned

emperor at Rome in 1046. The Normans next felt the weight of his hand. The emperor, whose first wife was a daughter of Canute the Great, died Oct. 5, 1056.

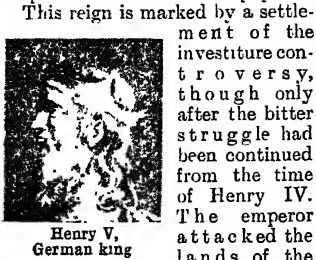

Henry IV (1050-1106). German king and Roman emperor. Born Nov. 11, 1050, he was the son of the emperor Henry III, who had him chosen and crowned king before he was four years old. This proceeding secured for him the throne when his father died in 1056, but for the next twelve years he was controlled by ambitious ecclesiastics, and did not really begin to reign until 1069.

Henry is chiefly known as the rival of Gregory VII. He refused to give up, at the papal command, the right to invest the German bishops with their lands, and was excommunicated. Alone he would probably have been able to resist the pope, but the alliance of the latter with the powerful forces of discontent in Germany, especially strong in Saxony, was too much for him, and in 1077 he submitted to Gregory at Canossa. The reconciliation did not endure; excommunication by the pope was answered by declarations of deposition by Henry, and rivals were put forward to both parties. He was for a time hard pressed, but gradually he wore down his foes.

In 1081 Henry went to Italy, gained successes in the north, and, after several rebuffs before its walls, entered Rome in 1084. Gregory was dethroned and besieged, and his successor Clement III crowned Henry emperor. The last period of Henry's life was troubled by risings on the part of his sons. The elder, Conrad, found support in Italy, but not in Germany, where Henry, the younger, had many friends. The malcontents made the old emperor prisoner, and forced him to abdicate, but he managed to escape from their hands and was preparing for a new campaign when he died at Liège, Aug. 7, 1106. *See* Empire; Gregory VII.

Henry V (1081-1125). German king and Roman emperor. The son of the emperor Henry IV, he was born Jan. 8, 1081. When his elder brother Conrad revolted, the elder Henry named him as his successor, and, the princes consenting, he was crowned as such in 1099. However, he revolted against his father, who died Aug. 7, 1106. Henry then became sole king, and in 1111 he was crowned emperor in Rome. A previous ceremony for this purpose broke up in violent disorder, and this

one was preceded by disorder in Rome between the forces of the emperor and those of the pope.

Henry V,
German king

This reign is marked by a settlement of the investiture controversy, though only after the bitter struggle had been continued from the time of Henry IV. The emperor attacked the lands of the pope and his friends, and set up anti-popes of his own, in return he was excommunicated and his enemies encouraged. The concordat of Worms signed in 1122 was a compromise. When not in Italy, Henry was fighting against rebellious vassals. He died at Utrecht, May 23, 1125. He married Matilda, daughter of Henry I of England, but left no children. See Investiture.

Henry VI (1165-97). German king and Roman emperor. Son of the emperor Frederick I, he was educated by clerics for the high position marked out for him by his father. When only four years old the emperor had him chosen and crowned as his successor, and when nineteen he acted as ruler of Germany. The main interest of his life arose from his marriage in 1186 to Constance, the heiress of the kingdom of Sicily, an event which led to serious trouble between pope and emperor.

In 1190, on Frederick's death, Henry began his short reign. At once he went to Italy, where the death of the king of Sicily had just given him another crown. He was crowned emperor in Rome, but he found the rebels in his southern kingdom, which included Naples, too strong for him. In Germany, too, his foes were strong and numerous, but after a year or two of fighting he brought about something like peace. In 1194 he went to Sicily; this time his armies were stronger than those of his rival Tancred, whose death took place at this time, and he was crowned king at Palermo.

This achieved, and Germany more peaceful, Henry sought to extend his power in other directions. His one aim being to make himself overlord of the kings of Europe He had just put down a fresh rising in Italy when he died at Messina, Sept. 28, 1197. Henry was a man of some culture.

Henry VII (c. 1270-1313). German king and Roman emperor. A son of Henry III, count of Luxemburg, this prince was a Frenchman

in speech and sympathy, but, doubtless because he was none too powerful, was chosen German king in 1308. He did what he could to restore order in Germany, and in 1311 went to Italy, where Dante and the Ghibellines hoped he would restore the authority of the empire. But although crowned emperor in 1312, Henry was quite unequal to this achievement in the face of his strong and numerous enemies. He died at Buonconvento, near Siena, Aug. 24, 1313. His son was John, the blind king of Bohemia, who fell at Crecy. On Oct. 30, 1320, his remains were removed from the Campo Santo at Pisa to the cathedral, where a monument had been erected.

Henry I (1008-60). King of France. A son of King Robert and a grandson of Hugh Capet, he was crowned king in his father's lifetime. In 1031 his father died, and he reigned alone until 1059, when he made his own son Philip his colleague, dying Aug. 4 in the following year. His reign was spent in warfare, first with his brother Robert, and then with his vassals, prominent among whom was William of Normandy, the Conqueror of England. He also had relations, not always friendly, with the pope and the emperor Henry III.

Henry I,
King of France

Henry II (1519-59). King of France. Son of Francis I, he passed part of his early life in Spain, where from 1526-30 he was a hostage. In 1533 he married Catherine de' Medici, and in 1536 became heir to the throne on the death of his elder brother Francis. For the next ten years he occupied himself mainly in dissipations, was dominated by his mistress, Diana of Poitiers, and quarrelled with his father, one difference being due to the dauphin's Spanish sympathies. In 1547 he became king, and his rule of eleven years was a period of oppression at home and war abroad. His favorites managed everything in their own interests, for the manly frame of the king was not matched by a manly spirit.

During a tournament held to celebrate a double wedding in the royal family, Henry was wounded

Henry II,
King of France

in the head by the lance of the count of Montgomery on June 30, and he died July 10, 1559. Three of his sons Francis II, Charles IX, and Henry III, came to the throne; the other was Francis, duke of Anjou. One of his daughters was the wife of Philip II of Spain, and another of Henry of Navarre.

Henry III (1551-89). King of France. Third son of Henry II and Catherine de' Medici, Henry was born at Fontainebleau, Sept. 19, 1551. In 1573 he was elected, against his own will, king of Poland. Soon the death of his elder brother, Charles IX, in 1574, brought him back to France as king. Although a man of considerable ability, the real ruler of his kingdom was his mother. He found a dangerous enemy in Henry, duke of Guise, and all but lost his crown on the Day of Barricades, May 12, 1588, when the Guise party engineered a rising in Paris, and then sought in vain to placate popular discontent by summoning the states-general at Blois. There, Dec. 23, 1588, he treacherously caused Guise to be assassinated. Excommunicated, he tried to retrieve his power by an alliance with the Huguenots and Henry of Navarre, whom he recognized as his heir, but he was mortally stabbed in Henry's camp at St. Cloud by Jacques Clément, Aug. 1, 1589.

Henry IV (1553-1610). King of France. Born at Pau, Dec. 14, 1553, he was a son of Antony of Bourbon and his wife, Jeanne d'Albret, queen of Navarre. He was brought up as a Protestant, and spent part of his youth at the French court, where he was educated, for the Bourbons were a younger branch of the royal family. The union was made closer by Henry's marriage in 1572 with Margaret, sister of Charles IX; six days later the massacre of St. Bartholomew occurred. In the same year he became king of Navarre. His life had been spared by his promise of conformity to Roman Catholicism, but in 1576 he joined the Huguenot leaders.

The absence of children to the French king and his brothers made Henry an important person in France, and for the next 13 years he was concerned in its various intrigues. He began his career as a soldier by leading the Huguenots in the short war that ended in 1580, and in 1586-87 he carried

Henry III,
King of France

him back to France as king. Although a man of considerable ability, the real ruler of his kingdom was his mother. He found a dangerous enemy in Henry, duke of Guise, and all but lost his crown on the Day of Barricades, May 12, 1588, when the Guise party engineered a rising in Paris, and then sought in vain to placate popular discontent by summoning the states-general at Blois. There, Dec. 23, 1588, he treacherously caused Guise to be assassinated. Excommunicated, he tried to retrieve his power by an alliance with the Huguenots and Henry of Navarre, whom he recognized as his heir, but he was mortally stabbed in Henry's camp at St. Cloud by Jacques Clément, Aug. 1, 1589.

Henry IV (1553-1610). King of France. Born at Pau, Dec. 14, 1553, he was a son of Antony of Bourbon and his wife, Jeanne d'Albret, queen of Navarre. His life had been spared by his promise of conformity to Roman Catholicism, but in 1576 he joined the Huguenot leaders.

The absence of children to the French king and his brothers made Henry an important person in France, and for the next 13 years he was concerned in its various intrigues. He began his career as a soldier by leading the Huguenots in the short war that ended in 1580, and in 1586-87 he carried

on another. The Guises were determined to prevent his accession, but events compelled Henry

Henry IV,
King of France
After Porbus

III to recognize the king of Navarre, who became titular king of France on the former's assassination, Aug. 1, 1589. Henry had now to conquer his kingdom, which he did by a wise mixture of diplomacy and force. He won the battles of Ivry and Arques and successfully besieged Rouen in 1592, but he was foiled before Paris, and more potent than arms was his politic conversion in 1593 to Roman Catholicism—Paris, he said, was worth a Mass. In 1598 Philip II of Spain, who had helped his enemies, made the peace of Vervins, and France, granted the edict of Nantes, which gave complete toleration to Huguenots, was more than ready to accept Henry as king.

Henry's reign was a period of comparative prosperity. Under a great finance minister, Sully, much was done for industry; the burdens on the people were reduced and the evils of the civil war to some extent remedied. Abroad the house of Hapsburg was watched jealously, its ambitions being checked by steady encouragement to its enemies. War had just been declared upon the emperor when, on May 14, 1610, the king was assassinated by Ravalliac. Henry owed his popularity to the circumstances of his reign, the relief it brought from civil strife, and to his own qualities, his courage and gaiety, frankness and amiability. His passion for women was notorious; he had many mistresses and several illegitimate children. But immorality and pleasure did not interfere with regal duty or domestic policy. His lawful issue included Louis XIII, Gaston, duke of Orleans, and Henrietta Maria, the queen of Charles I.

Henry, Sir Edward Richard (1850-1931). British police organizer. He entered the Indian civil service in 1873 as an assistant magistrate-collector and in 1891 became inspector-general of police in Bengal. In 1901 he was

appointed an assistant commissioner of the London metropolitan police, and was commissioner 1903-18. He had studied the Indian custom of impressing thumb prints on legal documents; and at Scotland Yard he used this knowledge, together with Dalton's scientific treatise on finger prints, as a basis of the filing system which now enables the police to identify one finger print from thousands in a few minutes. Henry was knighted 1906, made a baronet 1918, and died Feb. 19, 1931. See *Criminology*.

Henry, George (1858-1943). Scottish painter. Born in Ayrshire, he studied at the Glasgow school of art. In 1890 a picture of The Druids, executed in collaboration with E. A. Hornel, called attention to both painters, and in the same year Henry's Galloway Landscape, at the Glasgow Institute, marked a new departure.

In 1893 he accompanied Hornel to Japan; but the visit, so far from enhancing his liking for brilliant colour patterns, was followed by a leaning towards more restrained tones. Rich colouring and tone distinguish The Blue Gown, now in the Cape Town gallery; The Mirror, Gold-fish, and The Blue Veil are representative of his nameless portraits. He was elected A.R.S.A. 1892, R.S.A. 1902, and R.A. 1920. He died Dec. 23, 1943.

Henry, Joseph (1799-1878). American physicist. Born at Albany, N.Y., Dec. 17, 1799, he

Joseph Henry,
American physicist

became professor of mathematics and natural philosophy at Albany academy in 1826. There he at once showed a remarkable ability in electrical research and experiment, improving the electro-magnet so that his experiments marked a definite epoch in the practical applications of the electric current. In 1831-32 Henry carried out experiments in the transmission of electric current which foreshadowed the invention of the telegraph. His discovery in 1842 that the discharge of a Leyden jar induced discharges in other circuits some distance away was fundamental to the theory of wireless telegraphy. In 1846 Henry was appointed secretary to the Smithsonian Institution. Died May 13, 1878. The Henry, electric unit of self-induction, bears his name.

Henry, Matthew (1662-1714). British nonconformist divine. He was born at Broad Oak, Flintshire, Oct. 18, 1662, and studied for the law. In 1687, having been ordained, he became a Presbyterian minister at Chester, where he was extraordinarily influential. He remained there until 1712,

Matthew Henry,
Nonconformist
minister
From a print

when he became minister of a church in Mare St., Hackney. He died at Nantwich, June 22, 1714, and there is a monument to him at Chester. Henry is specially noted for his Exposition of the Old and New Testament, frequently republished, which was completed by several nonconformist divines.

Henry, O. Pen-name of William Sydney Porter (1862-1910), American short-story writer and

O. Henry,
American author

journalist. Born at Greensboro, North Carolina, Sept. 11, 1862, the son of a doctor, he was educated at a private school there, and acted for a time as prescription clerk in a drug-store. In 1882 he moved to Texas, where, in his own words, he "ran wild." He also wandered in Central America and was for a time in New Orleans. Eventually, in 1894, he became editor and part owner of a humorous weekly journal, The Rolling Stone, in Austin, Texas, where he also worked as a bank clerk. The venture failed. In 1895 he joined the staff of a Houston newspaper, but in 1896 was sentenced to five years' imprisonment following a charge of embezzlement. While in the penitentiary he wrote (1898) the first of that sequence of brilliant short stories which brought him fame when he moved to New York early in the 20th century. Settling there he quickly established himself as a highly popular writer, his work appearing in all the leading magazines. He died in New York, June 5, 1910.

Thirteen volumes of his short stories were published, of which the first, Cabbages and Kings, appeared 1905, and the last, Waifs and Strays, posthumously. The other volumes were The Four

Million, The Voice of the City, The Heart of the West, The Gentle Grafter, Roads of Destiny, Options, Sixes and Sevens, Rolling Stones, Whirligigs, The Trimmed Lamp, and Strictly Business. A number of his stories were laid in S.W. and Central America, others in New Orleans; but the two titles named first in the foregoing list give the clue to O. Henry's richest source of material, the life of the common people of New York, which he called Baghdad-on-the-Subway. His alert sympathy no less than his quick humour gives him kinship with Dickens; while as a master-craftsman of the short story he ranks with Maupassant and Kipling. His style, apparently casual and well decorated with idiom, is unique; and none has equalled the skill with which he contrives the unexpected *dénouement*. Many of his best stories, e.g. The Gift of the Magi, have found their way into anthologies.

In Great Britain O. Henry remained an almost unknown name until some years after his death, when the issue of his books in cheap editions during the First Great War created something of a vogue. *Consult* O. Henry, C. A. Smith, 1916; The Caliph of Baghdad, R. Davis and A. Maurice, 1931.

HENRY, PATRICK (1736-99). An American orator and statesman. Born at Studley, Va., May 29,

1736, he was of Scottish-Welsh descent. Unsuccessful as farmer and tradesman, he took up law, and rapidly

built up a practice. In the Virginia house of burgesses he violently attacked the Stamp Act of 1765 and favoured an immediate rupture with Britain. A delegate to the Continental Congress of 1774, at the Virginia Convention of 1775 by an eloquent speech he induced the members to pass resolutions for arming the state. It was here that Henry exclaimed, "Give me liberty or give me death." While governor of Virginia, in 1788, at the convention assembled to ratify the federal constitution, he opposed its introduction as calculated to infringe the rights of individual states. He died June 6, 1799. *Consult* Life, Correspondence, and Speeches, W. W. Henry (grandson), 1891.

HENRY OF HUNTINGDON. English chronicler. A cleric in the diocese of Lincoln, Henry lived in the early 12th century and wrote a History of the English from the coming of Julius Caesar to the reign of Henry II.

HENRY THE LION (1129-1195). German prince. The son of Henry the Proud, duke of Bavaria and Saxony, he belonged to the Welf family. In 1139 he became duke of Saxony and Bavaria, but his friends had to fight for his rights, which were threatened by Conrad III. In 1142 peace was made: Henry gave up Bavaria and kept Saxony. His name was to be made as a soldier of ambition and gallantry.

He extended the Saxon boundaries by driving back or conquering the heathen tribes beyond the Elbe. He recovered Bavaria, being granted the duchy by the emperor Frederick I, who was anxious for his assistance in his Italian wars. This Henry gave until 1175. In 1181 the emperor invaded Saxony, and the duke soon submitted. Of his great possessions he was allowed to keep Brunswick and Lüneburg only, while he was banished until 1185. He died Aug. 6, 1195. Henry, who married Matilda, daughter of Henry II of England, was ancestor of the electors of Hanover and kings of Great Britain. *See* Frederick I; Saxony.

HENRY THE MINSTREL (BLIND HARRY) (d. c. 1492). Scottish poet and reciter. Said to have been a native of Lothian, and blind from his birth, he made a living by reciting a poem of his own composition, into which he wove all the traditional stories about William Wallace. There are several entries in the royal treasurer's accounts of payments to him, 1490-92. His poem, written in the Lothian dialect, and consisting of more than 5,000 couplets, exists in a MS., dated 1488, preserved in the National Library of Scotland. A modernised version, by William Hamilton of Gilbertfield, 1722, was long popular in Scotland.

HENRY THE NAVIGATOR (1394-1460). Portuguese prince. The son of King John I, he was born at Oporto, March 4, 1394. His mother was a daughter of John of Gaunt. He took part in the conquest of Ceuta, 1415. He began to send out sailors on voyages of discovery, and with intervals continued to do so for 45 years. He himself went on one or two voyages, but he was mainly occupied with organizing and financing the expeditions.

These opened up the W. coast of Africa, found the Cape Verde Islands, and rediscovered the Azores. Henry made his home at Sagres, where he erected an observatory, set on foot something like a college of navigation, and had an arsenal. He died Nov. 13, 1460. *Consult* Henry the Navigator, E. Sanceau, 1946.

HENRY VII'S CHAPEL. Eastern extension of Westminster Abbey (*q.v.*). Founded by the king after whom it is named, it replaced the 13th century Lady Chapel in 1503-19. Henry VII intended it to be the shrine of Henry VI, who is buried at Windsor; it became his own burial place. At the E. end, in the apse, are five small chapels; the nave or central chapel is divided from the S. aisle or Margaret Chapel, and the N. aisle or Elizabeth Chapel, by the stalls of the knights and esquires of the order of the Bath (*q.v.*). In length 104 ft., breadth 70 ft., unrivalled in its sculpture, the fan tracery of its roof, its stone statues of saints, beautiful specimens of later medieval art, stone panelling and traceried windows, it is the finest example of late Perp. architecture in the U.K. The name of its architect is unknown. The chapel was "restored" by Wyatt, 1807-22.

On the large oaken and bronze-covered doors, the grille surrounding Henry VII's tomb, and in the E. window are badges or emblems symbolical of Henry's claim to the throne. In the vault beneath the tomb, the work of Pietro Torrigiano, rest Henry VII, his wife Elizabeth of York, and James I. Below the altar Edward VI was buried. W. of the altar were interred George II and Caroline of Anspach. In the N.E. chapel of the apse is the grave of Anne of Denmark; in the S.E. chapel that of Dean Stanley. In the S. or Margaret Chapel, lie Mary Queen of Scots, Charles II, many other members of the Stuart line, Mary II, William III, Queen Anne and her husband, Prince George of Denmark. Features of the N. aisle or Elizabeth Chapel are the tomb of Queen Elizabeth, whose coffin rests on that of her half-sister, Mary; and the grave of Addison.

In 1940 the window in the easternmost of the five little chapels forming the *chevet* of Henry VII's Chapel was destroyed by a German bomb. It was replaced by Hugh Easton's stained glass unveiled on July 10, 1947, in memory of air crews who lost their lives in the battle of Britain,

Henry VII's Chapel. Tomb of Henry VII and his queen in the famous Tudor Gothic chapel in Westminster Abbey. Round the walls hang the banners of the Knights of the Bath, with which it has been associated since 1725

July 10-Oct. 31, 1940. Resting on a lectern is the roll of honour. See Fan-Tracery illus.

Henry Esmond, THE HISTORY OF. Novel by Thackeray, usually referred to for the sake of brevity as *Esmond* (q.v.).

Henry Frederick (1594-1612). Eldest son of James I of England. He was born at Stirling, Feb. 19, 1594. In 1604 negotiations were begun for his betrothal to the infanta Anne of Spain, but they fell through. Sent to Oxford in 1612, the prince seems to have loved sport better than study.

Created prince of Wales in 1610, he died of fever Nov. 6, 1612, to the grief of the country.

Henryson, ROBERT (c. 1430-c. 1500). Scottish poet. He was a schoolmaster at Dunfermline, and perhaps also a notary. Among his poems are *Robene and Makyne*, the first pastoral in the Scottish language, the *Testament of Cresseid*, a sequel to Chaucer's *Troilus* and *Criseyde*, a metrical version of Aesop's *Fables*, and *The Bludy Oak*, an allegory.

Henschel, SIR GEORGE ISIDORE (1850-1934). An Anglo-German musician. He was born in Breslau,

Feb. 18, 1850, and studied music at Leipzig. In 1877 he came to England, where he appeared as a baritone. During 1881-84 he conducted symphony concerts at Boston, U.S.A. Returning to England, he devoted himself to singing, teaching, and conducting, and founded the London Symphony concerts, which he conducted 1884-95. In 1881 he married Lilian June Bailey (1860-1901), an American soprano. He became a British subject in 1890, and was knighted in 1914, dying Sept. 10, 1934. His compositions include the opera *Nubia*, songs, church music and chamber music. He wrote *Musings and Memories of a Musician*, 1918.

Henslowe, PHILIP (d. 1616). English theatre proprietor. Born in Sussex, he settled in Southwark. He specialised in theatres and less reputable places of amusement. With Edward Alleyn (q.v.), who married his stepdaughter, he built the Fortune Theatre at Cripple-gate, and had financial dealings as impresario and money-lender with many Elizabethan dramatists. His diary is preserved in the college library at Dulwich.

Henson, HERBERT HENSLEY (1863-1947). British prelate. Born in London, Nov. 8, 1863, he was a non-collegiate student at Oxford and was elected fellow of All Souls in 1884. He was ordained and became head of Oxford House, Bethnal Green, where he worked until made vicar of

H. Hensley Henson, British prelate

Barking, 1888-95. Incumbent of S. Mary's hospital, Ilford, in 1900 he was chosen canon residentiary of Westminster and rector of S. Margaret's. There he remained until 1912. As dean of Durham he took an active interest in the university. In 1918 he was consecrated bishop of Hereford, and in 1920 was translated to Durham, retiring 1939. In 1940-41 he was a canon of Westminster. He died Sept. 27, 1947.

Henson was a leading exponent of broad church ideas, including a close cooperation with non-conformists. He advocated reform of the Prayer Book, and when this was opposed by parliament he declared for disestablishment of the Church. An incisive style made him a formidable controversialist in such books as *Anglicanism*, 1921; *In Defence of the English Church*, 1923; *Christian Morality*, 1936. *Retrospect of an Unimportant Life* appeared in two vols., 1942-43.

Henson, LESLIE LINCOLN (b. 1891). British comedian. Born Aug. 3, 1891, he went to Emanuel

Leslie Henson, British comedian

School. Having worked with concert parties, he appeared on the London stage in pantomime in 1910. His adroit patter, combined with perfect timing and an unusual range of comic facial expressions, established him as a leading comedian in musical comedy, e.g. *To-Night's the Night*, 1915, *Kissing Time*, *The Cabaret Girl*, *Funny Face*, 1928. During 1930-34 he was co-lessee with Firth Shephard of the Strand Theatre, where he appeared in *It's a Boy and It's a Girl*. A series of musical comedies at the Gaiety, 1935-38, followed, including *Seeing Stars* and *Going Greek*. Henson produced and played in

Up and Doing, 1940; Fine and Dandy, 1942; 1066 and All That, 1947; Bob's Your Uncle, 1948; Harvey, 1950. His autobiography, *My Laugh Story*, appeared 1926.

Henty, GEORGE ALFRED (1832-1902). British war correspondent and writer for boys. Born at Trump-

George A. Henty,
British writer,
Elliot & Fry

ington, near Cambridge, Dec. 8, 1832, he was educated at Westminster and Caius College, Cambridge. He served in the purveyor's department of the British army in the Crimean War. In 1866

he became correspondent for the *Standard*, and saw much fighting. These experiences he turned to good account in his long series of books for boys, which he began to write in 1868. Among the best are *The Young Frano-Tireurs*, *The Cat of Bubastes*, *The Young Carthaginian*, *The Lion of St. Mark*, *With Clive in India*, *By Pike and Dyke*. Henty died at Weymouth, Nov. 16, 1902.

Henzada. District, subdivision, and town of Burma, in the Irawadi division. Of the district area, about one quarter is under cultivation, and nearly the whole of the cultivated ground is devoted to rice. The exports consist largely of rice, while the imports include cotton and silk piece goods and chinaware. Henzada town, on the Irawadi, 65 m. W.N.W. of Pegu, is an important trade centre, connected by rly. with Bassein. Area of dist., 2,870 sq. m. Pop., dist., 693,271; town, 23,651.

Heparin. Active anticoagulant substance prepared from liver. It delays blood clotting without damaging the plasma or cells, and is chiefly employed in blood transfusion; a solution may be injected into the donor before transfusion, or added to the blood after withdrawal. After an operation it may be injected if there is danger of thrombosis. Heparin has been crystallised as a barium salt.

Hepatica (*Anemonë hepatica*). Perennial herb of the family Ranunculaceae, native of Europe. The thick dark green leaves are deeply divided into three oval lobes; the flowers are blue, each on a long stalk direct from the rootstock, the showy portions consisting of the sepals.

Hepburn, SIR JOHN (c. 1598-1636). Scottish soldier of fortune, a native of East Lothian. He prob-

ably attended St. Andrews university. In the Thirty Years' War in Germany he fought under Mansfield, then under Gustavus Adolphus of Sweden became colonel of a regiment from which the Royal Scots directly descend. Hepburn was at the siege of Frankfort-on-Oder, helped to win the battle of Leipzig, 1631, and took Donauwörth. After Gustavus's death he entered the French service, being killed at the siege of Saverne (Zabern), July 8, 1636.

Hepburn, KATHARINE (b. 1909). American film actress. A New Englander, she was born Nov. 9, 1909, and after a brief stage career entered films in 1932, winning praise in *A Bill of Divorcement*. Her notable pictures included *Christopher Strong*; *Morning Glory*; *Little Women* (in which she played Jo March); *Quality Street*; *Stage Door*; *The Philadelphia Story*; *Woman of the Year* 1942.

Hephaestus (Gr. *Hephaistos*). In Greek mythology, god of fire and the working of metals. He was the son of Zeus and Hera, but was so disliked by his mother that she threw him out of Olympus. On another occasion Hephaestus, having offended Zeus, was again thrown out, falling for a whole day and landing in the island of Lemnos. He is represented as having been lame from birth or lamed by his fall.

Some accounts make him the husband of Charis, one of the Graces; others the husband of Aphrodite. The famous armour of Achilles and Aeneas, and the fire-breathing bulls of Aestës which guarded the golden fleece, were the work of Hephaestus. His chief workshop was in Lemnos, but various volcanic islands, such as Sicily, were also supposed to be the scene of his activities. At Athens he was associated with Athena and Prometheus, with whom he has many points of resemblance, and festivals with torch-races were held in their honour. Hephaestus was identified by the Romans with Vulcan. See *Aeschylus*; *Vulcan*.

Hepplewhite, GEORGE (d. 1786). English furniture maker. After serving his apprenticeship with Gillow, a cabinet-maker at Lancaster, he started a business in London which his widow carried on after his death as A. Hepplewhite & Co. Drawings supplied by this firm were published in *The Cabinet-maker and Upholsterer's Guide* in 1788.

Hepplewhite's name is identified with the style in furniture which

followed the Chippendale period, and was a cautious revolt against the solidity of the latter. Its characteristic was the curvilinear, all the pieces having sweeping lines, with a leaning to the classic style of the Directoire modified by English sturdiness. In the tracery of cabinets and bookcases straight rather than curving lines were used. The cabinets were placed on tall legs, usually square, though also round, and tapered. The chairs had shield, oval, circular, hoop, and interlaced heart, fretwork backs. See *Chair*; *Furniture*.

Heptameron, THE (Gr. *hepta*, seven; *hēmera*, day). Stories written in the 16th century, in imitation of Boccaccio's *Decameron*, by Marguerite, queen of Navarre. The book tells of a company of lords and ladies who, returning from the baths at Cauterets, were detained in a beautiful spot for seven days by the flooding of a stream in the Pyrenees, and devoted the time to telling extremely sprightly stories. See *Boccaccio*; *Italy*; *Literature*.

Heptarchy. Word derived from the Greek *hepta*, seven, and denoting the seven kingdoms (*archai*) into which Anglo-Saxon England was supposed to have been divided before 900. The seven presumably were Kent, Essex, Sussex, Wessex, Mercia, East Anglia, and Northumbria. See *England*; *History*.

Heppworth (JOCELYN) BARBARA (b. 1903). British sculptor. Born Jan. 10, 1903, at Wakefield, she studied art at Leeds, and at the Royal College of Art. Closely related in kind to the sculpture of Henry Moore (*q.v.*), but narrower in range, her carving revealed an intense precision and mastery of form. She tended to use ovoid shapes as a basis, and many of her designs resembled musical instruments. A member of Unit One, she became a leading exponent of the abstract, exhibiting at London galleries. See *Art illus.* p. 665.

Hera. In Greek mythology, sister and wife of Zeus and daughter of Cronos and Rhea. One of the major deities of ancient Greece, by Zeus she became the mother of Arës, Hephaestus, and Hëbë. She is generally represented as of a jealous disposition, and she displayed the utmost vindictiveness towards those with whom her husband had amours. Among those persecuted by her were Semelë and her child Bacchus or Dionysus, and Hercules.

Hera had frequent quarrels with her husband, and on one occasion plotted with Athena and Poseidon

BARNARDISTON
Azure, a fesse dancetté, ermine, between six cross crosslets, argent

FENWYKE
Per fesse, gules & arg., six maillets counterchanged

BLOUNT
Barry rebulé of six pieces, or and sable

WITTEWRONG
Bendy of six, arg. and gules, on a chief, azure, a bar indented, or

POPE
Per pale, or & az., on chevron between 3 griffins' heads erased, 4 fleurs-de-lys all counterchanged

OLDFIELD
Or, on a pile, vert, three garbs of the field

LAWSON (of Isell)
Per pale, arg. and sa., a chevron counterchanged

GELL
Per bend, az. and or, three mullets of six points in bend, pierced and counterchanged

WILLIAMS (of Llangothby)
Gyronny of eight, ermine and sable, a lion rampant, or

FLETCHER
Arg., a salure, engr., gu., between 4 roundels of 2nd, each charged with a pheon of the field

GUISE
Gules, seven lozenges, vair, three, three, and one

WILLOUGHBY
Or, two bars, gules, each charged with three water-bougets, arg.

SPENCER
Quarterly, az. & gu.; in 2nd & 3rd quarter a fess, or; over all, a bend sa. charged with 3 escallops, arg.

ACTON
Quarterly, per fesse indented, argent & gules; in first quarter a Cornish chough, sable

DORMER
Az., ten bulets, or, 4, 3, 2 & 1, on a chief of second, a demulion issuant, sa.

HOLLES
Erm., two piles, issuant from upper part of dexter & sinister gules, between 2 torseaux; 2nd saltire sable, 5 fleurs-de-lys of first, all within a bordure gobony, or and sa.

SMITH (of Isleworth)
Quarterly, 1st & 4th, az., a lion ramp., or; on a chief, arg., a mullet; 2nd saltire sable, 5 fleurs-de-lys of first, all within a bordure arg.

HAWKINS
Per saltire, or & arg., on a upper part of dexter & sinister gules, between 2 torseaux; 2nd saltire sable, 5 fleurs-de-lys of first, all within a bordure arg.

WYVILL
Arg., three chevrons interlaced, vair, a chief, or

ROBERTS
Arg., six pheons, sa., on a chief of second, a greyhound courant of first gorged, or

JOHN DE BEAUMONT
Az. semé-de-lys & lion rampant or, over all a bend gobony arg. & gules

VISCOUNT DOWNE
Or., on a bend cotised sa., three annulets of the field

MACKWORTH
Party per pale indented, sable and ermine, a chevron gules, fretty or

WM DE COURTENAY
(Archbp. of Canterbury)
Or, three torteaux, on a label of three points az., as many mitres arg.

ROBERT DE VERE
Quarterly 1st and 4th az., 3 crowns or, within a bordure arg.; 2nd & 3rd, quarterly gules and or, in first quarter a mullet argent

Arg., a chevron gules between three cross crosslets fitché sable, all within a double tressure flory and counter-flory of the second

JOHN DE HASTINGS, K.G.
(Earl of Pembroke)
Quarterly De Hastings & De Valence & impaling France ancient and England quarterly

to put him in chains. For this she was beaten by Zeus and herself put in chains. Her annoyance with Paris (*q.v.*) for his judgement against her for the ownership of the golden apple led her to side with the Greeks in the Trojan War. As a married goddess, her special province was to preside over childbirth. The pomegranate, symbol of fertility; the cuckoo, in which form Zeus gained her favours; and the peacock were sacred to her. The Romans identified her with Juno (*q.v.*).

Heraclea. Ancient city of Magna Graecia, Italy. It stood on the N.W. coast of the Gulf of Taranto, near the modern Policoro. A Greek colony, it was founded about 432 B.C. by Tarentum and Thurii, on the site of Siris. It became the locale of the general assembly of the Italic Greeks. Near here, in 280 B.C., Pyrrhus defeated the Romans. Afterwards it became a Roman municipium, receiving a bronze copy of the Lex Julia Municipalis, discovered in the vicinity in 1753. These Tabulae Heracleenses are one of the chief sources of our knowledge of the ancient municipal laws. Little remains of the ancient city.

Heraclea Minoa. An ancient Greek city of Sicily. It stood on the S. coast, W. of Agrigentum. Originally a Phoenician settlement, it was called Minoa from a tradition that it was built by Minos. It fell into the hands of the Spartans about 510 B.C. and changed ownership many times. In 383 B.C. it owned the sway of Carthage, but was later on destroyed by the Carthaginians, rising again from its ashes, and becoming a Carthaginian naval station in 314 B.C. It finally decayed, and few traces of its buildings remain.

Heracleidae. In Greek legend, the sons and descendants of Hercules or Heracles. Zeus had willed that the sons of Heracles should rule in Peloponnesus, but Hyllus, the eldest son, and his brothers were expelled by Eurystheus, king of Argos, and forced to seek refuge at Athens. After several attempts the Heracleidae regained possession of their inheritance, and founded the kingdoms of Argos, Lacedaemon, and Messenia. The legend has a basis of historical fact, the conquest of Peloponnesus by invading Dorians, probably led by Achaean chiefs. This invasion is known as the return of the Heracleidae.

Heracleopolis. Greek name of the ancient city Heren-suten at Ahnas, Upper Egypt. Situated on

the right bank of the Bahr Yusuf, 10 m. W. of the Nile at Beni Suef, 71½ m. above Cairo, it was the capital of Middle Egypt during the IXth and Xth dynasties. It was sacred to the ram-headed god Hershef, whose correlation with Heracles occasioned its Greek name.

Heracian (d. A.D. 413). Roman general and usurper. For the murder of Stilicho (408), he was made count of Africa by the emperor Honorius, to whom he rendered valuable assistance in putting down the usurper Attalus set up in Rome by Alaric. Having been raised to the consulship he proclaimed himself emperor and landed in Italy, but after a severe defeat returned to Carthage, where he was put to death by the emperor's orders.

Heraclitus (c. 540-480 B.C.). Greek philosopher. A citizen of Ephesus, he was known as the weeping philosopher from his pessimistic view of human life, and as the Dark from the obscurity of his style. Like his predecessors of the Milesian school, he referred all substances composing the material world to one element, but whereas Thales held that one element to be water and Anaximenes held it to be air, Heraclitus believed that all things were variants of fire, typical of absolute unrest, the perpetual dissolution of continuance. He also held that everything was in a state of flux or movement, like the stream of a river, and that any idea of permanency about anything was an illusion of the senses. Nothing exists, but only becomes, and all becoming is the result of the conjunction of opposites; "strife is the father of all things." The only permanency is to be found in the reason underlying all movement; this reason he identifies with Zeus. Becoming, the principle of Heraclitus, is the exact opposite of Being, the principle of the Eleatics. See Philosophy. *Pron. Herra-cly-tus.*

Heraclius (c. 575-642). East Roman emperor 610-642. Born in Cappadocia, son of the governor of Africa, he seized the throne at a critical period, the empire being threatened by the Persians in the E. and by the Avars and Slavs in the W. At length, having reorganized the army and borrowed money from the Church, Heraclius, after defeating the Avars, undertook a series of campaigns against Persia, and gained a decisive victory near Nineveh (627) over Chosroes II.

This success, however, was counterbalanced by serious losses

of territory in the W. For the rest of his reign, Heraclius was chiefly occupied with religious disputes as to the nature of Christ, and issued an Ecthesis (edict) asserting that in spite of two natures there was only one will in Christ (Monothelitism). While thus engaged, a new foe had arisen—the Arabs, who made themselves masters of Syria and Egypt. Overwhelmed by anxieties, Heraclius left the empire at his death in a deplorable condition.

Heraeum (Gr. *Heraion*). Temple of Hera, about 6 m. from Argos, in Peloponnesus, ancient Greece. This temple was the centre of the worship of Hera for the whole Greek world. Burned down in 423 B.C., it was rebuilt with great splendour. Especially famous was the great statue of the goddess in ivory and gold by the sculptor Polycleitus. Considerable excavations have been made on the site, as a result of which terra-cotta figurines, vases, and other objects of art have been found.

Heraclēs or **HERACLES**. Greek form of the name of Hercules (*q.v.*).

Heraclion. Another name for the largest city of Crete. See Candia.

Herald (old Fr. *herault*). Name, of doubtful etymology, given to certain officials. In the Homeric age of ancient Greece, the herald or *kéryx* (one who proclaims) acted as confidential servant to the kings and princes, waited upon them at table, and acted as their representative. In historical times his functions were religious, political, and judicial. He examined the victims for sacrifice, recited prayers before any public business was undertaken, convened the public assemblies, summoned litigants to the court, instructed the proper officials to carry out its sentence, proclaimed the lists of those publicly honoured and of the victors of the Olympic games. The herald's person was sacred; he had free meals in the Prytaneum, a seat of honour in the theatre, and received a salary. His special badge of office was the staff, *kérykeion*, latinised as *caduceus* (*q.v.*).

In Rome, the herald (*praeco, caduceator*) was a less important person, no religious character being attached to his office. He was a public or private crier, who gave notice when anything was lost in the streets, and played a part at auctions like that of the modern auctioneer. There were also heralds in the service of the state and attached to the higher magistrates whose duties more or less corresponded to those of the Greek

kérykes. The *praeco* and *caduceator* were distinguished as the messengers of peace from the *fetiales*, whose responsibility was to declare war with certain solemn formalities.

In early medieval times the heralds acted as messengers of sovereign princes, and had, among other duties, to convey challenges, open negotiations for armistices and peace, and take part in matrimonial and other ceremonies. Thus they gradually assumed largely the functions of masters of the ceremonies and recorders of pedigrees and alliances. Hence, when armory arose and the knights began to decorate their shields and banners with distinctive symbols, to avoid confusion and ensure proper order being observed, the heralds were appointed to look after armory, register pedigrees, and see that knights observed conduct becoming their dignity. In England they were made into a college of arms.

Apart from the heralds who are members of the college many others were instituted from time to time, by kings of England and by princes. Thus a herald styled Bath king of arms, who does not belong to that corporation, was attached to the order of the Bath when revived by George I, and another king of arms, with no distinctive appellation, is an official

Herald. Norroy King of Arms reading the proclamation of the accession of George VI at Chancery Lane, London, Dec., 1936

of the order of S. Michael and S. George. Heraldsextraordinary may also be occasionally appointed. Until Tudor times many great nobles, such as the Percys, Nevills, earls of Salisbury, and Sir John Chandos, one of the original knights of the garter, had their own pursuivants, named after the family badge or crest, who acted as the family heralds and genealogists, as well as messengers to their masters.

HERALDRY AND COATS OF ARMS

* Anthony R. Wagner, *Richmond Herald*

In this work there are articles on all the chief terms used in heraldry, e.g. Cadency; Charge; Cross; Quartering; Saltire; Supporter. See Coat of Arms; Knighthood; Peerage; and articles on Howard and other noble families

In the strict sense of the word, heraldry embraces all those duties which fall within the domain of the herald, and so comprises genealogy, the rules of precedence and official ceremonial, and the art of armory. Generally, however, the term is restricted to the last-named branch, which is concerned with the devices placed on shields or banners as distinguishing marks of individuals, families, or territorial divisions, as well as the ornaments surrounding the shield.

Heraldry as a science, resting on hereditary descent of such devices as a fundamental fact, cannot be traced further back than the early 12th century, though there were signs of it nearly a hundred years earlier, and no doubt it owed a great debt to that art of symbolism adopted in remote ages and by many peoples to distinguish tribes and individuals. Some of the symbols or charges used in heraldry are unquestionably of

extreme antiquity. Such are the snake-like dragon, the lion, and the single and double-headed eagle, as well as such conventionalised floral and plant forms as the cinquefoil.

All these and many more may be found on the coins, pottery, and monuments of ancient Greece and Rome, often shown as decorating the shields or standards of warriors. Some of these charges may also be traced on Assyrian monuments and in the hieroglyphics of Egypt (where we see them representing dynasties, gods, and territorial divisions), and even among savage races chiefs and whole tribes are found using distinctive head-dresses or tattoo marks. Many of these symbols were totemistic, and to that degree were really hereditary to a family. But in the main, outside totemism and those symbols attributed to tribal or local divinities, the devices found in antiquity and among barbarian people were personal, and do not

often show stability even in that restricted sense.

This want of stability characterises the early heraldry of Europe. While it is extremely likely that over most of Europe certain totemistic, tribal, and territorial devices subsisted well into the feudal days, there is no direct evidence that they were used on shields, helmets, or standards. An important influence on the early development of heraldry was probably the tournament, which by the end of the 12th century was a widespread institution. Knights who took part in tournaments were leaders in war, and their personal and family emblems were important in both contexts.

Symbol of Identity

As the armour of the Christian knights became heavier and thus more effective as an agency for concealing individuality, the advantages of these identity symbols, serving as signs for rallying scattered henchmen, became self-evident, and were gradually adopted. Some of the best known feudal coats of arms appeared only towards the 13th century.

No heraldic symbol of any kind appeared on the great seals of kings of England before Richard I. His first great seal has no such device as three lions, but we see on the shield borne by his equestrian figure a lion rampant. The three lions passant guardant do not appear until his second seal.

Heralds are first heard of on the Continent late in the 12th century, but in England not until the reign of Edward I. Their primary concern was with the conduct of tournaments, but this from the first necessitated a knowledge of armorial bearings, and as time went on their concern with the latter assumed relatively greater importance. They made heraldic collections known as rolls of arms; and under Henry V, if not earlier, they had responsibilities for ensuring that arms were not assumed without right.

The court of chivalry, under the constable and marshal, tried cases where the usurpation of arms was alleged, from the reign of Edward III to that of George II. Its most famous achievement was the trial of the issue between Sir Richard le Scrope and Sir Robert Grosvenor, both of whom claimed a golden bend on a blue field. From 1385 to 1390 a splendid array of French, Scottish, and Continental chivalry appeared to give evidence, and finally Richard II delivered judgement in favour of le Scrope. By

degrees the unsystematic recording of arms by the heralds developed into regular surveys called visitations, with the dual purpose of recording genuine arms and checking their improper assumption. Henry VIII in 1530 put these surveys on a strict legal basis which continued till 1688. The records of these visitations are preserved in the Herald's College.

Although at first many of the armorial devices assumed were personal, the basis soon became in the main feudal and territorial; i.e. many of the most prized coats of arms were attached to fiefs. Consequently we find that men of noble birth and ancient lineage who became possessed of important fiefs by inheritance, marriage, or gift, commonly gave up their paternal arms for those of the territorial dignity.

In many more instances they were quartered or otherwise incorporated. Another peculiarity of these feudal territorial arms was that, with certain modifications, they were assumed or granted to sub-feudatory families or families related to the great chief. A good illustration of this is seen in the golden wheat sheaves of Chester, borne by the earls of Chester, and found on the shields of a large number of old Cheshire families, including the Grosvenors.

Armorial Complications

It was the medieval theory that the unaltered arms of a family belonged only to its head for the time being, and that his younger brothers and sons and even his heir in his lifetime must "differ" them in some way. With time, the increasing number of coats of arms in use made it progressively more difficult to difference one without producing an undue resemblance to some other; and differences were replaced by the marks of cadency. Finally even the use of these was dropped.

As time advanced the work of the professional armorists, though preventing chaos, introduced many complications, doing away with the charming simplicity of the early feudal days. These restrictions and complications went on steadily increasing, until by the 19th century the original beauty and direct appeal had vanished, too often under a mass of meaningless absurdities. Moreover, as blazoning and marshalling of arms became more complicated, so did the dexterity and bold spiritedness of the heraldic artist diminish. This deterioration of heraldic art became most swift in the early 18th

century and went on past the mid-Victorian period. Then came a revival of heraldry, a harking back to the feudal examples, which gave birth to a painstaking school of heraldic artists.

In blazoning, heralds distinguish four main divisions—the field (the surface of the shield or banner); tinctures (colours, metals, and furs); charges (animated creatures, celestial bodies, flowers, and plants, inanimate objects and conventional figures placed as distinguishing ornaments on the field); and externals, which include crest and badge, helmet, coronet or cap, supporters, mantling, and distinguishing devices.

Degrees of Coat-Armour

In coat-armour ten degrees were recognized. 1. Arms of dominion, belonging to a sovereign state. 2. Arms of pretension, borne in their entirety, in a shield of pretence over the paternal arms, or quartered, by a prince claiming dominion over another state. 3. Arms of community, belonging to religious, charitable, and scholastic establishments, corporate bodies, including cities and boroughs, chartered guilds and companies. 4. Arms of patronage, or arms of community and office borne by certain holders of office, such as bishops, abbots, heralds. 5. Arms of succession, borne by inheritors and grantees of fiefs and manors. 6. Arms of assumption, or arms of a vanquished foe assumed by the victor (more often part of the arms or crest were assumed). Some heralds made another division for arms of territorial assumptions, or those borne by a non-ruling claimant to a territory, which are practically identical with No. 2. 7. Paternal arms, descending from father to children, and in certain cases hereditary from the maternal side. 8. Arms of alliance, or the arms of a wife, borne in an escutcheon of pretence (a small central over-all or *surtout* shield) if she is an heiress, or impaled otherwise; the arms of the heiress being quartered by the children with their paternal arms. 9. Arms of adoption, borne by strangers in blood by virtue of a gift by will or other deed, for which sanction by the sovereign is required. 10. Arms of concession, or arms of honourable augmentation, being complete coats of arms, parts of coats of arms or special charges or devices (crests or supporters) granted by the sovereign as a special favour.

The field or shield was plotted out into various sections to facilitate blazoning. The left side, as

viewed by the spectator, is called the *dexter*, the right the *sinister*, it being assumed that the shield is borne by the owner. The top is the chief, or in chief; the middle the fess point; the space between this and the chief is the honour point; and the bottom part the base.

As regards tinctures, gold and silver, together with the five colours, red, blue, green, black, and purple, to which a dark blood-red and orange were later added, were universally recognized; also ermine and those quaintly conventionalised other furs, vair and potent. It was generally laid down that metal should not rest on metal, nor colour on colour, but there are numerous exceptions, especially on the Continent.

First among the great body of charges come conventional or geometric figures, broad bands or crosses, called ordinaries. These are spacious and very properly may bear other charges. In early heraldry overloading was avoided, yet the heraldic artists always endeavoured to fill the shield or banner. If a king of England bore a shield broad at the top and narrowing to a point at the base, the topmost lion was a big, bold beast, the one beneath a little smaller, and the third a tiny animal. These fundamental ideas of design and the need to fill space appropriately had their influence on blazoning. Thus three charges on a shield, unless special directions are given, are borne two above and one below.

Bearing of Crests

A coat of arms may be complete without a crest. As a matter of fact, crests were either borne by the prescriptive right of long usage, or were the subject of specific mention in grants, the original assumption being that they should be borne only by warriors, or at least by those entitled to levy or to lead men-at-arms. No woman except a sovereign princess was entitled to use a crest.

Apparently in the course of visitations, applicants who considered a crestless armorial shield incomplete, or those anxious to advance pretensions, put forward old family badges or personal devices and got them recognized by the *comptant* presiding herald as genuine crests. This abuse and the bad taste of the heralds account for so many absurd figures being employed as crests, many of which would be quite impossible ornaments to helmets intended for personal wear, which, of course, is the test of the genuinely old.

The use of supporters (*e.g.* the lion and unicorn in the British royal arms) came in fairly late; they were a matter of accidental growth, mere external ornamentations, but speedily recognized as of value in denoting alliance and territorial dominion. They were long only partially admitted as hereditary.

In later practice supporters are supposed to be borne only by sovereigns, princes, peers and their eldest sons, and those enjoying the right by special grant—a form of augmentation. But from the 16th century English heralds made it common form to grant supporters in connexion with arms of community, particularly those given to guilds and chartered companies.

Unfortunately the multiplication of rules begat a race of uninspired heralds who blazoned by rule of thumb and thought that piling on of detail and over-elaboration in marshalling tended to increase dignity, though it really detracted from novel simplicity and led to a succession of worthless follies.

The Appreciation of Heraldry

Heraldry meant much in the days when armorial bearings and other heraldic insignia appeared on signets and more formal seals, glittered in jewelled glass windows, glowed on tapestried or painted walls, even on personal garments, marked the possession of treasured books, and told graphically on the illuminated genealogical scroll or spreading family tree the story of cherished alliances. It played a useful part, appreciated by historian and antiquary and no less by the artist. Employed with discretion, it still fills a place, and is as helpful to the family annalist as it is to the decorative artist of sound taste.

Bibliography. A Complete Body of Heraldry, J. Edmondson, 1780; An Ordinary of British Armorial, J. W. Papworth, 1874; The General Armory, Sir B. Burke, 1884; The Book of Public Arms, A. C. Fox Davies, 1915; A.B.C. of Heraldry, G. C. Rothery, 1915; The Romance of Heraldry, C. W. Scott Giles, 1929; Papal Heraldry, D. L. Galbraith, 1930; Heraldry in England, A. R. Wagner, 1946.

Heralds' College or **COLLEGE OF ARMS.** Society incorporated and endowed in 1483 by Richard III, to attend the earl marshal's court, and determine upon descents, pedigrees, escutcheons, and the like. The college is composed of the three kings of arms (Garter, Clarenceux, and Norroy), the six heralds (Windsor, Chester, Lan-

caster, York, Richmond, and Somerset), four pursuivants Rouge Croix, Bluemantle, Rouge Dragon, and Portcullis), and two extra heralds.

The members are nominated by the earl marshal, and hold their places by patent during good behaviour. Their general duties are to attend the sovereign at the house of lords, and on certain high festivals to the chapel royal; to make proclamations, marshal the proceedings at public processions, and attend the installation of the knights of the garter. They grant coats armorial to persons properly authorised to bear them, and invent and emblazon devices when no hereditary arms are known to belong to the applicant for a grant. The original college was destroyed in the Great Fire, 1666. The present brick edifice in Queen Victoria St., London, E.C.4, was built about 1669 by Wren. It contains a fine panelled hall with a carved throne.

Hérat. City of Afghanistan, sometimes called the key of India from its strategic position. It is the capital of the prov. of the same name, and is situated on the Hari Rud, at an alt. of 3,000 ft., about 400 m. almost due W. of Kabul, and 60 m. from the Russian and Persian frontiers. Founded by Alexander the Great, it is a great centre of roads. It stands in a beautiful and fertile district, and manufactures fine carpets and silks. Pop. 85,000.

Hérault. A river of France. Rising on the slopes of Mont Aigonal, in the Cévennes, it flows first S. and then S.W. along the foot of the S. buttress of these mts., and issues into the Gulf of Lions near Agde. The chief towns on its banks are Valleraugue (Gard dept.), Amiane, Gignac (Hérault dept.). Length, 78 m.

Hérault. Maritime dept. of France. It adjoins the depts. of Aude, Tarn, Aveyron, and Gard, and its coast, consisting chiefly of a string of sandy lagoons (*étangs*), is on the N.W. of the Gulf of the Lion. It formed part of the old prov. of Languedoc. Towards the sea the ground slopes gently, but in the N.W. rise the Monts de l'Espinouse and Monts Garrigues, the southern flanks of the Cévennes. The principal rivers are the Hérault and Orb; part of the Canal des Étangs runs through the dept. from Aigues Mortes (Gard) to Cette, the Canal du Midi continuing to Agde, Béziers, and into the dept. of Aude.

The vineyards are the most important commercial feature of

Hérault, and there are several important mineral workings, *e.g.* copper, lead, and building stone. Salt is produced from the neighbourhood of the lagoons, and Cette has a large fishing fleet. The most important towns are the capital, Montpellier, Lodève, Bédarieux, Pézenas, Ganges, and Frontignan. Area, 2,402 sq. m. Pop. 461,000.

Hérault de Séchelles, MARIE JEAN (1759-94). French Revolutionary. A Parisian, he was born Sept. 20, 1759. He was a lawyer and literary figure before he took part in the capture of the Bastille, and then as judge and member of the legislative assembly (president from Sept., 1792) moved to the extreme Left. Frequently president of the convention, he drew up the constitution of 1793 and was appointed to the committee of public safety. Having incurred the enmity of Robespierre, he was guillotined with the Dantonists, April 5, 1794.

Herb. Plant whose stem, from the absence of woody tissue, dies to the ground annually. Herbs, however, may be annual, biennial, or perennial in duration. Annuals spring from the seed, flower, fruit, and die all within one season. Biennials during their first season accumulate a store of food in an underground rootstock which is expended the second season in the production of an aerial stem, flowers, and fruit; then they die. Perennials produce annual stems in succession during an indefinite number of years, such stems dying in autumn after their valuable contents have been withdrawn in an underground rootstock, tuber, bulb, or corm. The word herbs is used by gardeners to indicate plants, whether herbs or shrubs botanically, employed for flavouring in cookery, such as horehound, mint, parsley, rue, sage, tansy, and thyme. A herbalist is one who deals in herbs, especially those useful for medicinal purposes. Before the medical profession reached its present ubiquity, many persons resorted to herbalists in cases of illness. A herbal is a book in which plants and names are described. See Botany.

Herbaceous Plants. Plants wholly of soft material, without woody stems. They are either annual, produced from seed and dying within the same year; biennial, produced from seed one year and dying the next; or perennial, when the rootstock survives in the ground, while the season's growth dies down before the approach of winter. See Garden.

Herbarium (Lat.). Collection of dried plants attached to loose sheets of paper, arranged in genera, and these again grouped in the natural orders. In making such a collection, care should be taken to select typical and perfect specimens, showing all the parts of the plant, root, stem, leaves, flowers, and fruit. They are dried, under increasing pressure between many changes of fairly absorbent paper, before they are mounted, and then attached by narrow strips of gummed paper or by cotton stitches. The cabinet in which they are stored should not be placed against an outer wall, or the specimens will be attacked by mould. Camphor or naphthalene should be freely used in the cabinets, which should be frequently inspected, to keep away destructive insects. See Botany.

Herbart, JOHANN FRIEDRICH (1776-1841). German philosopher and educationist. He was born at Oldenburg, May 4, 1776, and while a tutor in Switzerland, in 1797, made the acquaintance of Pestalozzi, whose system aroused in him an interest in education. In 1805 he became professor of philosophy at Göttingen, and in 1808 succeeded Kant at Königsberg. The result of his educational theories was seen in the foundation of a pedagogical seminary. In 1833, having incurred the displeasure of the Prussian authorities by his advanced ideas, he returned to Göttingen, where he died Aug. 14, 1841.

At first a follower of Fichte, Herbart later found himself at variance with him on the question of human freedom. He denied that man was free and independent of circumstances, and reverted to Kant's theory that behind the world of sense there were a number of real things, unaffected by the operations of the mind. These "reals," resembling the atoms of Democritus and the monads of Leibniz, are simple elements, differing in quality, which act and react upon one another in a struggle for self-preservation, and thus originate the physical world. The soul is one of these reals, whose reactions give rise to presentations which become ideas. These ideas act as forces striving for possession of the threshold of consciousness.

Herbart was the first to raise education to the dignity of a science. His views have had much influence,

especially in America, where there is a Herbart Soc. Consult The Secret of Herbart, F. H. Hayward, 1907.

Herbert, SIR ALAN PATRICK (b. 1890). British writer and politician. Born Sept. 24, 1890, he

Sir Alan Herbert,
British writer

was educated at Winchester and New College, Oxford, and was called to the bar in 1918. From 1910 he contributed to Punch, joining the staff in 1924. An outstanding wit, he published volumes of light sketches, satirical and topical verse, and attacks on the misuse of English. Of his novels *The Water Gipsies*, 1930, and *Holy Deadlock*, 1934, were best known, though a war book, *The Secret Battle*, 1919, was highly esteemed. As a librettist he excelled in comic opera and revue, e.g. *Riverside Nights* (with N. Playfair), 1925; *Tantivy Towers*; *Derby Day*; *Streamline* (with R. Jeans); *Big Ben*; *Bless the Bride*, 1947.

Herbert represented Oxford university as Independent Conservative M.P. 1935-50. In 1937 he introduced a bill amending the law of divorce; this was passed as the Matrimonial Causes Act (see Divorce). A warm defender of the individual against bureaucratic interference, he was knighted 1945. In the Second Great War he was a petty officer in the naval auxiliary patrol. He pub. his autobiography in 1950.

Herbert, GEORGE (1593-1633) English poet and divine. Born in Montgomery, Wales, April 3, 1593, younger brother of Lord Herbert of Cherbury, he was educated at Westminster School and Trinity College, Cambridge. He became fellow, 1616, and was public orator, 1619-27. Disappointed of court preferment under James I, he turned to the study of divinity. He was prebend of Leighton Bromswold, Hunts, with the stall of Leighton Ecclesia in Lincoln Cathedral, 1626, restored the church of S. Mary, Leighton, was rector of Fuggles-ton with Bemerton, near Salis-

bury, Wilts, 1630-33, where he repaired the church (S. John's) and rebuilt the parsonage. He married Jane Danvers, of Baynton, Wilts, 1629, and, dying of consumption, was buried in Bemerton church, March 3, 1633. The church at Bemerton was restored in 1866.

Herbert's saintly life at Bemerton is reflected in the manual *A Priest to the Temple*, or the

George Herbert,
English poet
From a print

Country Parson, His Character and Rule of Holy Life, first printed in 1652. His chief work, *The Temple, Sacred Poems and Private Ejaculations*, planned in reference to church architecture, and packed with thought and precept, was first printed 1633, and ran through two editions in that year; by 1670, 20,000 copies had been issued. The MS., now in the Bodleian, was given by Herbert, on his death-bed, to his friend, Nicholas Ferrar, of Little Gidding.

Read by Charles I in prison and praised by Crashaw, Henry Vaughan, Baxter, and Coleridge, *The Temple* ranks with the best religious verse in the language. The Pilgrimage has been described as Bunyan's *Pilgrim's Progress* in miniature. The conceits in the verse are attributed to the influence of Herbert's friend, John Donne. Herbert found his chief relaxation in his devotion to music.

Bibliography. *Life*, L. Walton, 1870, often reprinted; *Works*, ed. A. B. Grosart, 1874; R. A. Willmott, 1885; G. H. Palmer, 1905; *The Temple*, ed. E. C. Gibson, 1899; G. Herbert and His Times, A. G. Hyde, 1907.

Frith

Herbert, Sir John Arthur (1895-1943). British administrator. Educated at Wellington and Harvard, he was commissioned in the Royal Horse Guards in 1916, and served on the Western Front. Retiring from the army in 1934, he entered parliament as Conservative at a by-election in Monmouth, becoming in 1937 private secretary to Lord Stanley at the India office. In 1939 he succeeded Lord Brabourne as governor of Bengal; his term was marked by great political difficulties, which obliged him to take emergency powers. His work in combating famine and organizing the war effort of the prov. overtaxed his health, and he was taken ill in Aug., 1943; resigned Oct. 22; and died Dec. 11.

Herbert of Cherbury, Edward Herbert, 1st Baron (1583-1648). English philosopher, historian, and diplomatist. Born at Eyton-on-Severn, near Wroxeter, March 3, 1583, he went to Oxford when a boy of fourteen. He afterwards travelled much on the Continent, where he made the acquaintance of Isaac Casaubon and Constable Montmorency, and gained the reputation of a skilful and fearless duellist and man of pleasure. In 1614 he fought with distinction under the prince of Orange in the Netherlands and was twice ambassador to Paris. He was recalled owing to a dispute with Constable de Luynes as to the treatment of the French Protestants, and a second time in connexion with the proposed marriage of Henrietta

Maria of France and Prince Charles. His services were rewarded with an Irish and then an English peerage as Baron Herbert of Cherbury. At first a supporter of the royalist party, he subsequently

Lord Herbert of Cherbury, English philosopher
From a contem. portrait

went over to the parliamentarians. He died in London, Aug. 20, 1648.

Herbert of Cherbury is usually called the founder of English deism, a system of natural religion. He assumes that all men are alike in the possession of certain common notions, in which the fundamental truths are represented. The five common notions of natural religion are: the existence of a supreme being; the duty of worshipping him; virtue and piety are the most important

elements of worship: the necessity for repentance of sins; a future life with rewards and punishments. Revelation is possible to individuals, but must not be opposed to these five notions. Natural instinct is the faculty whereby the common notions as to the relations of things are apprehended and applied without the process of reasoning. His chief work is *De Veritate* (On Truth), 1624.

Herbert of Lea, Sidney Herbert, Lord (1810-61). British politician. Born at Richmond,

Lord Herbert of Lea, British politician
After G. Richmond

Sept. 16, 1810, a younger son of the 11th earl of Pembroke, he was educated at Harrow and Oriel College, Oxford. He entered Parliament as Conservative M.P. for S. Wilts in 1833, and retained the seat till 1861. In 1834 he was made secretary to the board of control, and in 1841 secretary to the admiralty; there he remained until in 1845 he entered Sir Robert Peel's Cabinet as secretary at war. Still a Peelite, he returned to the same office in 1852, resigning in 1855 on the inquiry into the failure of the army organization in the Crimea. Herbert was responsible for sending thither Florence Nightingale. He returned again in 1859, but in 1861 resigned, having just been made a peer, and died Aug. 2. Two sons successively became earls of Pembroke.

Herberton. Town of Queensland, Australia. It stands 2,893 ft. above sea level, 82 m. by rly. S.W. of Cairns, its port. Once a mining centre, it still produces tin and some copper, wolfram, and other minerals. Pop. 869.

Herbertshöhe. Former name of the port in Neu Pommern (now New Britain), Bismarck Archipelago, now known as Kokopo (*q.v.*). As capital of Germany's Pacific colonies it was superseded 1910 by Rabaul, 14 m. N.W. It was captured by Australians, Sept., 1914.

Herb Paris (*Paris quadrifolia*). Perennial herb, one of the family Liliaceae. It is a native of Europe and N. and W. Asia. It has a stout white, creeping rootstock, a round

Herb Paris, foliage and flowers

stem, bearing near its summit a single whorl of four large oval leaves, and above them the solitary flower, consisting of four large green sepals and four very narrow yellow petals. The eight or more stamens are continued as long points beyond the anthers. The ovary is purple, very large, and shining, and develops into a black four-celled berry. The flower has an offensive odour which attracts flies. The plant resembles *Trillium*.

Herb Robert (*Geranium robertianum*). Soft, hairy annual herb, member of the family Geraniaceae.

Herb Robert, leaves and flowers

It is a native of Europe, N. Africa, and W. Asia. Its leaves are divided into five leaflets, which are again finely lobed and divided, smelling disagreeably when bruised (hence its local name of Stinking Bob). The flowers are pale purple, streaked with red, produced all through the season. The whole plant often turns red.

Herculaneum (Gr. *Herakleion*). Ancient Italian coast town, between Naples and Pompeii, at the foot of Mt. Vesuvius. Originally Oscan and closely connected with Greek Naples, it was occupied by the Samnites and finally by the Romans. In Nero's time it was greatly damaged by an earthquake, and in the autumn of 79 was totally destroyed, together with Pompeii, by an eruption of Vesuvius. The villages of Portici and Resina were built over the site. In 1719, during the sinking of a well, parts of the ancient city were discovered. Excavations were carried on thereafter at irregular intervals. The town had been buried to a depth of 50 feet under volcanic mud which had solidified, so its investigation presents great technical difficulties.

Herculaneum. General view of the excavations looking along one of the streets of the buried Roman city

In 1927 modern scientific excavation was undertaken by the Italian government.

The town was smaller, with far less commercial activity, than Pompeii. Its architectural remains are of less interest and variety, except its houses, which show points of interest not found at Pompeii; its works of art are superior, and include a picture of Theseus and the Minotaur, and exquisite bronzes. Great hopes were once aroused by the discovery, in a country house outside the walls, of a large collection of papyrus rolls, but they proved of little value. *See* Vesuvius; *consult* Herculaneum, Waldstein and Shoochbridge, 1908. Ercolano, A. Maiuri, 1932.

Hercules. Northern constellation situated between Lyra and Boötes. One of the Ptolemaic constellations, it contains several double and variable stars, and the globular cluster Messier 13.

Hercules (Gr. *Heraklēs*). Hero in Greek classical mythology. He was the son of Zeus by Alcmēnē, wife of Amphytrion, king of Thebes. The jealous Hera, wife of Zeus, sent two serpents to destroy the baby Hercules in his cradle, but the infant strangled them both with his hands. Receiving the hand of Megara, daughter of the king of Thebes, as reward for having slain Erichonius, king of Orchomenus, the oppressor of the Thebans, he had by her several children, whom, driven mad by his old enemy Hera, he slew. After being purified of this deed, Hercules was instructed by the Delphic oracle to go to Tiryns and serve Eurystheus, the king, for twelve years.

It was for Eurystheus that he performed the celebrated Twelve Labours: (1) The slaying of the Nemean lion, which he strangled

with his own hands; (2) The destruction of the many-headed Hydra of Lerna, a swamp near Argos; (3) The capture alive of the Arcadian stag, with golden antlers and brazen feet; (4) The capture alive in a net of the Erymanthian boar; (5) The cleansing of the stables of Augeas, which he carried out in a night by turning the rivers Alpheus and Peneus through them; (6) The destruction of the Stymphalian birds, monsters with brazen beaks and claws, and feeders on human flesh; (7) The capture of the mad bull which Poseidon had sent to Minos, king of Crete; (8) The capture of the man-eating horses of Diomedes, king of the Bistones in Thrace; (9) The taking of the girdle of Hippolytē, queen of the Amazons; (10) The seizure of the oxen of Geryon, the three-headed monster of the island of Erytheia; (11) The taking of the three golden apples from the garden of the Hesperides; (12) The bringing of Cerberus, the three-headed dog of Hades, from the lower world.

Besides these labours Hercules performed many other deeds. In the war between the gods and the giants he assisted Zeus to victory; he accompanied the Argonauts in the expedition in quest of the Golden Fleece; and he rescued Hesione, daughter of Laomedon, from a sea-monster. Going mad a second time, he murdered his friend Iphitus. Ordered by the Delphic oracle to work three years for wages as an atonement and to give the wages to Eurystus, father of Iphitus, he entered the service of Omphale, queen of Lydia. On a visit to Calydon he won the hand of Deianira, who, becoming jealous, sent him a poisonous shirt, steeped in the blood of the centaur Nessus. Hercules put the shirt on and the

poison caused him such pain that he tore strips of flesh from his body in his attempt to pull off the shirt. In this condition he was brought to Trachis, and made arrangements for his own funeral pyre. When the pyre began to burn, a cloud descended upon it in which Hercules was borne away to Olympus. The worship of Hercules was first introduced to Greece by the Phoenicians, the original object of adoration being the Babylonian sun god Baal, who goes through twelve labours as he goes through

Hercules. Antique colossal statue known as the Farnese Hercules
Naples Museum

the twelve signs of the Zodiac. In Italy the worship of the Greek Heracles was combined with that of an old Italian hero. *Pron.* Her-culeez. *See* Greek Art.

Hercules, PILLARS OF. Ancient name for the rocks forming the entrance to the Mediterranean Sea, i.e. Calpe (Gibraltar) in Europe, and Abyla (Ceuta) in Africa. Various legends describe them either as torn asunder by Hercules to admit the Atlantic or as joined together to keep out the ocean monsters.

Hercules Beetle. Large species of beetle. Belonging to the genus *Dynastes*, it is found in the tropical

Hercules Beetle. The male carrying his mate between his horns

districts of America. It is often between five and six inches long; and the male has a pair of large horns which somewhat suggest the pincers of a crab.

Hercynian Forest. In ancient geography, a vast forested mountain region N. of the Danube. Caesar in his commentaries on the Gallic War says it took nine days to cross, while in some parts 60 days' march did not avail to reach its limits. It seems to have included the modern Switzerland, the entire Alpine mass, Transylvania, and part of Russia.

Herder, JOHANN GOTTFRIED VON (1744-1803). German critic and poet. He was born at Mohrungen, East Prussia, Aug. 25, 1744, of humble parentage. At Königsberg university he was much influenced by Kant. He became a school teacher and pastor at Riga in 1764, and thanks to Goethe's interest became first preacher at Weimar, 1776. He had already published strong criticisms of Lessing's *Laocöon*, in *Kritische Wälder* (Critical Forests), 1769, and other writings.

Herder occupied a dominating position among critics of his period. His love for the songs of the people as supporting his theory that poetry was the natural language of man bore fruit in his *Stimmen der Völker in Liedern*, 1778-79, and other works. One of his chief works is the *Ideen zur Philosophie der Geschichte des Menschheit* (Ideas on the Philosophy of the History of Mankind), 1784-91, Eng. trans. 1800. Herder died at Weimar, where he was vice-president of the consistory, Dec. 18, 1803. Consult Herder and his Times, H. Nevins, 1884.

Herdman, SIR WILLIAM ABBOTT (1858-1924). A British scientist. Born in Edinburgh, Sept. 8, 1858, he studied at the academy and university there. His chief subject was zoology, and having been on the Challenger expedition, he was for a short time a demonstrator of zoology in Edinburgh. Made professor of natural history at Liverpool in 1881, he began his work of investigating the ocean. He helped to found a marine biological station at Port Erin, Isle of Man, while for the British government he investigated the pearl fisheries of Ceylon. Herdman served the British Association as general secretary, and in 1920 he was its president. His many honours included the F.R.S. and his writings *The Fauna of Liverpool Bay*, 1896-1900.

First professor of oceanography at Liverpool from 1919, he died July 21, 1924.

Heredia. Central province of Costa Rica. Its surface is mountainous, the highest point being the peak of Desengano, in the centre, which attains 6,310 ft. The uplands afford splendid pastures for the rearing of cattle, and the fertile valleys produce much coffee, which is exported. Pop. 55,156.

Heredia, the capital of the prov., stands on a plateau at an alt. of 3,785 ft., about 5 m. by rly. N. of San José. It is a well planned town, with wide streets, and substantial buildings. Motor roads join it to Cariago and Alajuela. Pop. 18,979.

Hérédia, José MARIA DE (1842-1905). French poet. Born at Fortuna Capere, Santiago de Cuba, Nov. 22, 1842, of mixed French and Spanish origin, he was educated in Paris,

J. M. de Hérédia,
French poet

and early became a disciple of Leconte de Lisle, and a member of the Parnassian school of poets, who regarded poetic form as being of supreme importance. His sonnets, collected under the title of *Les Trophées*, 1893, place him among the greatest writers in this species of poetry. He died Oct. 3, 1905.

Heredia, PEDRO AND ALONSO DE. Two brothers who conquered Colombia for Spain between 1530 and 1545. Pedro was the founder of the city of Cartagena.

Hereditament (late Lat. *hereditare*, to inherit). Term of English law. It refers to property that can be inherited, i.e. which goes to the heir and not to the personal representative. The term is wider than the term real property. It includes titles, advowsons, rights of common, rights of way, certain offices—e.g. the office of earl marshal of England is hereditary in the family of the dukes of Norfolk—dignities, e.g. peerages and baronetcies, franchises, e.g. markets and fairs, pensions, annuities, and rents. Some of these, such as rights of common and rents, issue out of land; others are purely personal, like peerages and pensions.

HEREDITY: A BIOLOGICAL PROCESS

Comyns J. A. Berkeley, Lecturer in Biology, Chelsea Polytechnic

The group of articles to which this belongs includes Biology; Eugenics; Evolution; Life; Mendelism; Reproduction; Sex. See also Cell; Cytology; Family; Genetics; Instinct, etc.

Heredity is the phenomenon of the transmission of characters and qualities of organisms to subsequent generations. It is the direct result of reproduction in which process new organisms are initiated as masses of living material derived from their parents.

Every organism, so far as is known, originates in this way and grows to show numerous recognizable features of structure and behaviour. The process of growth itself is dependent on the parental provision of living substance and, among other things, on the intake of material, e.g. food or its equivalent, from the surroundings. So we may say that every organism is the product of the interaction of its vital inheritance and its environment, and this is also true of its characters. Some of these, e.g. those by which we recognize the various kinds of plants and animals, appear in generation after generation, no matter how the environment varies: an elephant has a trunk and tusks whether born and reared in the tropics or in a zoological garden; a monkey puzzle tree is a monkey puzzle whether grown in Chili or at Kew.

Hence it must be presumed that apart from providing the conditions suitable for the life of the organism, the environment has little effect on such characters. Their appearance must be due essentially to the nature of the vital material provided to initiate each generation by its parents. They are heritable characters and their transmission is due to heredity. Many characters both structural and functional, besides those diagnostic of species, belong to this category, though the constancy of their appearance may not be as marked.

On the other hand, such characters as the callosity of labourers' palms, the tanned skin of the white man caused by exposure to intense sunlight, and the blue coloration of normally pink hydrangea flowers, become apparent or result from modification of pre-existing features only under certain conditions. In these instances, although the vital material must have a capacity to change so as to exhibit the particular character, the actual change is induced by the environment, and hence the character which results is said to be an

J. G. von Herder,
German critic

induced or acquired character or a modification.

In general the parts of organisms which are concerned with their everyday activities, their bodies or somata, in contrast to their reproductive cells, must have prolonged intimate relations with the environment in order to perform their functions; for the reproductive cells such relationship is at most transitory. Hence it is not surprising that induced characters are frequently seen in somata and not usually in reproductive cells, nor, since the induced characters are modifications of somata and new organisms are derived from reproductive cells, that modifications are not usually heritable.

In this connexion it is necessary to realize that in mammals generally, where the unborn offspring is carried by the mother, peculiarities in its nurture may modify its inherited nature and so, when it begins its independent existence, it may already have acquired characters which are not part of its heritable constitution. In the same way infection by pathogenic organisms may occur before birth, but the resulting disease is not to be regarded as inherited since it was not present *ab initio*. That is not to say that no disease is heritable. A number of physiological diseases, defects in the functioning of digestive and excretory organs, brain and blood, as opposed to pathogenic diseases due to the presence of foreign organisms, are known to be heritable, as are predispositions to infection by certain pathogens such as *bacillus tuberculosis*.

Transmission of Characters

In some instances there may be a semblance of transmission of acquired characters. Offspring which have the same heritable constitution as their parents, growing under similar conditions, will be likely to acquire for themselves characters previously acquired by the parents, and so it may appear that the character has been transmitted, but, unless the character appears again without the assistance of environmental influence, it cannot be regarded as inherited. A deeply saturating influence may occasionally affect the parental body and also bring about a modification in the reproductive cells so that the offspring come to be different, but when it does so the difference seen in the offspring is usually of another kind from that which is seen in the parental bodies. Should such a modification of

germ cells occur, the peculiarity resulting from it in the offspring is likely to be repeated in later generations. Thus, despite the facts that heredity tends to the regular reappearance of characters in succeeding generations and environmental effects tend to be limited to the bodies of individuals, should reproductive cells be affected, a corresponding heritable change will occur.

Variations of Incept

What an organism can be, and how it can behave, depend primarily on its material constitution, and this depends on the incept handed on from the previous generation. The nature of the incept differs with the method of reproduction. Many plants can multiply by vegetative means, e.g. strawberry plants, whose stolons root at their nodes, the internodes rotting to separate the new plants so established. In these instances the new individuals seldom show any differences in their features from those of their parents: they are in fact parts of the body of their one parent growing separately. Much the same is true of lowly animals arising by fission, e.g. amoeba, and by budding, e.g. hydra, or of plants, of which there are many, that grow from asexual spores. When, however, sexual methods involving two parents are used, and should those parents differ, it is obvious that no one of their offspring can resemble both in all particulars; the child of a brown-eyed father and a blue-eyed mother cannot have a pair of eyes which are both blue and brown. The sort of thing that may happen in such circumstances is discussed under Mendelism.

Mendel's original discoveries published in 1865 were the result of breeding experiments mainly on peas. He found, when he crossed a suitable tall pea plant with another that was dwarf, that the offspring resembled in stature one parent only—the tall one. The dwarf character did not, however, disappear from the race for ever. Breeding from the tall offspring gave a third generation, some only of which were tall, others were dwarf. Thus the dwarf character must have been latent (Mendel called it recessive) in the tall plants produced by the original cross. On the basis of experiments such as these Mendel postulated that an organism contains a number of "unit characters," that suitable characters of related organisms may be contrasted in pairs, and of any such pair one is dominant over

(appears to the exclusion of) the other (the recessive) when they are both inherited. Despite this both dominant and recessive characters may be transmitted separately to different members of the next generation. Such separate transmission of characters inherited though not necessarily exhibited by an organism Mendel explained by supposing that gametes (*q.v.*) can each carry that which determines (the determinant factor or gene for) one only out of any pair of contrasting characters, and it is this "purity of gametes" which makes the reappearance of a recessive character possible. The tall plants resulting from the original cross inherited a gene for tallness from their tall parent and one for dwarfness from their dwarf parent. They were tall owing to the dominance of the tall character. None of their gametes, however, could carry the genes for both characters, so some carried one and others carried the other. In breeding from the tall plants there could be no control of the actual unions of gametes, and fusions happened between similar or dissimilar gametes purely by chance. If a "tall" gamete united with another of its kind, the resulting plant inherited only "tall" genes. It was homozygous for tallness and grew into a tall plant. If a "tall" gamete united with a "dwarf" gamete, the plant was heterozygous and, because of dominance, tall like those of the previous generation. When two "dwarf" gametes fused, however, the plant was homozygous for dwarfness, and the dwarf character reappeared because there was no inheritance of tallness to mask it.

Mendel's Theories

In general, the characters of an organism depend on the genes present in the gametes which united for its initiation, not on the characters exhibited by its parents. The essential feature of the sexual union is bi-gametic rather than bi-parental in this respect. In fact, the tall plants produced by Mendel's original cross were allowed to pollinate themselves, as peas normally do, so that their offspring were (setting aside the alternation of generations) uni-parental.

It is apparent from the foregoing that although there are only two phenotypes (visibly different kinds), tall plants and dwarf plants, there are three genotypes (types by genetical constitution), homozygous tall, homozygous dwarfs, and heterozygous plants.

Of the genotypes, the first two each produce gametes of one kind only and hence can transmit to their offspring only that character which they themselves exhibit. The heterozygous plants, on the other hand, form two kinds of gametes, and so can transmit each character to different offspring despite the fact that they show only the dominant one. The gene which is actually passed on will cause the appearance of the appropriate character only if it is dominant or if the gamete concerned unites with another bearing the gene for the recessive character.

Breeding Experiments

Reverting to the brown-eyed father and the blue-eyed mother, it is now clear that unless we know which of the two characters is dominant and the genetical constitution of the parent which shows that character, we are in no position to predict the eye colour of their children. Facts such as these, when they relate to plants and animals, may be determined by direct breeding experiments and have been so determined in a number of instances. Moreover, when breeding experiments are conducted in such a way as to provide numerous offspring, the numbers of the various kinds of these are found to bear definite proportional relationships to one another according to the genetical constitution of the parents. For example, a cross between two heterozygous tall pea plants gives homozygous tall plants, heterozygous tall plants and homozygous dwarf plants in the proportions of 1:2:1, and between a heterozygous tall plant and a homozygous dwarf gives equal numbers of heterozygous tall and homozygous dwarfs.

All cases are by no means as simple as this. Observable characters may be determined by the interaction of genes; dominance may not be complete, and so on. But given a sufficiently extensive and descriptive family history, an expert could ascertain how pairs of characters behaved in relation to one another and the genetical constitution of any individual included. Inductive methods of this kind are used, because direct experiment is not feasible, in attempts to understand human heredity, but the data available are often scanty and so lead to deductions of probabilities rather than certainties.

THE CHROMOSOMES The physical basis of Mendelian heredity is now known to rest in the

chromosomes and their behaviour. Each gamete nucleus normally contains a haploid set of chromosomes (see Cytology) and, when gametes fuse, two such sets are brought together into the nucleus of one cell in which it is often possible to distinguish the pairs of homologous chromosomes of the diploid set. At some time in the life history varying with different organisms, before gametes are again formed, meiosis occurs, and the homologous chromosomes of the two sets are separated into different nuclei. So we have only to assume that the gene for any character is present in one chromosome and the gene for the allelic (alternative) character is in its homologue, and the mechanism leading to the purity of the gametes is apparent. The genes are separated into different gametic nuclei when the homologous chromosomes disjoin during meiosis.

The assumption that genes are resident in the chromosomes is supported by a number of cases known, where the nuclei of organisms having a certain character contain a chromosome which is, under the microscope, distinguishable by its structural peculiarity from its fellows. The character does not occur therefore in the absence of the peculiar chromosome nor is it absent when that chromosome is present.

Sex Chromosomes

One of the simplest illustrations of this is found in sex chromosomes. The fruit-fly *Drosophila melanogaster* has nuclei containing four pairs of chromosomes. In female flies, members of each pair are morphologically identical, but in male flies one member of one pair is somewhat larger than its homologue and is characteristically hooked. In man there are 24 pairs of chromosomes, the pairs being essentially alike in females, but in the male one member of one pair is smaller than its fellow.

It must not be inferred that along any line of inheritance there will be found only two recurrent types. In any species there may be recognized many characters, and these are normally transmitted from generation to generation in linked groups (see Cytology). Each group of characters, apart from its relations with the allelic characters, behaves independently of any other group. Out of a number of allelic pairs, A and a, B and b, C and c, etc., A is as likely as a to be carried by the same gamete that carries B

or by that which carries b; B and b are equally likely to be carried with C or c and so on. An individual heterozygous for three linkage groups A and a, B and b, C and c could form gametes containing them in the following mixtures: ABC, aBC, AbC, abC, ABc, aBc, Abc, abc. If there are n linkage groups 2^n mixtures of them are possible.

Linked Groups of Characters

Linkage and the independent assortment of linked groups of characters have been shown by cytogenetical experiments to be due to three facts: characters linked in the same group result from genes present in one chromosome; allelic genes occur in homologous chromosomes (see Cytology); in meiosis, homologous chromatids are separated into different nuclei accompanied, according to chance, by one or other member of every other pair of homologous chromatids. Again, although groups of characters are normally transmitted together, the linkage groups are sometimes broken, and recombinations of characters occur. So the constitution and behaviour of the chromosomes tend to cause characters to recur in successive generations in varying combinations.

On the other hand, the sum total of the characters of any line is not invariable. New characters may arise. Genes themselves may occasionally undergo modification and produce new characters in the organism containing them. These gene mutations, as they have been called, serve to increase the number of possible character combinations. The character induced by the mutated gene is generally found to be allelic to that controlled by the gene which became modified and to its original allele (alternative), so where in any line there were originally two possibilities and a gene mutation occurs, there then come to be three. In addition, occasional aberrant behaviour of whole chromosomes or nuclei may lead to gross modification of the nuclear complement and so to modification of characters.

NON-NUCLEAR HEREDITY. It is upon the remarkable similarity in the behaviour of chromosomes and contrasting characters that the chromosome theory of heredity is chiefly based. So few instances of inheritance have been investigated which cannot be explained on this basis that there is a tendency to ignore the possibility of any other mechanism. In many

instances, truly, it is impossible to show that male gametes consist of anything in addition to nuclear material, and in these it would seem that all characters derived from the male parent must be transmitted by the nucleus. But egg cells always have considerable cytoplasm, and the nuclei of male gametes are sometimes surrounded by demonstrable cytoplasmic envelopes which, in the sexual process, fuse with the cytoplasm of the female gamete. Thus in all instances new individuals are endowed with cytoplasm, it may be by both parents, it may be by the female only, and there is no evidence that this cytoplasm does not carry heritable qualities.

Genetical Experiments

That cytoplasmic inheritance is not yet fully investigated may be due to intrinsic difficulty. Genetical experiments depend essentially on difference in characters, and when differing characters within a species are investigated, they usually behave in the Mendelian manner, and hence may be ascribed to genes in the chromosomes. The natural inference is that if characters are transmitted by the cytoplasm, there are seldom in a species easily recognizable differences to serve as a basis for experiment. Moreover, the cytoplasm itself usually has no features comparable with the chromosomes of the nucleus by which its uniformity or otherwise in related individuals can be visually tested.

A few crosses have been made, however, which prove that the nature of the cytoplasm can affect characters. Thus when two species of willow herb, *Epilobium luteum* and *E. hirsutum*, are crossed, the hybrids have different characters according to which plant is used as the "female" parent. In the sexual union of these plants, as in flowering plants generally, both gametes contribute equal quantities of nuclear material to the zygote, but the maternal gamete provides most if not all the cytoplasm. So it would appear that the differences in the hybrids are due to the different cytoplasm of the egg cells. The probability is enhanced by the fact that when

the hybrid derived from a *luteum* egg is back-crossed with *hirsutum* pollen, the characters of the *luteum* egg hybrid are again evident in the offspring. Repetition of back-crossing through 14 generations produces the same result in each successive generation.

Even in those numerous instances where differential distribution of characters is clearly due to the nuclear mechanism, it is the cytoplasm that forms the chief part of the system which develops to show the heritable characters. The nuclei without the cytoplasm would be ineffective. Thus it appears necessary to consider the cytoplasm as reacting with the nuclei for the production of differential characters.

In a number of the lower plants chloroplastids are known to be passed from generation to generation. This is so in some species of the green alga *Spirogyra*, whose vegetative cells each contain a nucleus and chloroplastids. When sexuality occurs, the vegetative protoplasts are slightly modified to become gametes, and during their sexual union their nuclei fuse, and the plastids of one gamete degenerate but those of the other persist to initiate the plastid content of the new plant.

In sum, all parts of the protoplast which are handed on from

that character. Alternatively, uniformity might be engendered by the cytoplasm if the usual absence of visible difference between the cytoplasm of related individuals is truly indicative of identical constitution, or by any other protoplasmic structures which were not differentially distributed.

Hereford. City, mun. bor., and co. town of Herefordshire, England. It stands on the Wye, 144 m. W.N.W. London, and is served by two railway lines, being a railway centre of some importance. The notable building is the cathedral. Exhibiting several styles of architecture, this was begun about 1079, on the site of an earlier one, and was completed about 1110. Additions and alterations were

generation to generation may be concerned in heredity. Most cases of differential inheritance of characters so far investigated may be attributed to the functioning of the nuclear mechanism, though a few are known in which the type of cytoplasm is responsible. But uniform distribution of a character in a race would result if all individuals were homozygous for

Hereford. The main street, known as High Town. The timbered building in the background, known as The Old House, was built in 1620. The tower and spire are of All Saints' Church. Upper picture, the bridge over the Wye, with Cathedral tower beyond

made in the 13th and 14th centuries; restorations after the western tower fell, 1786, and in the 19th

century; in 1900-05 the west front was reconstructed. Features are the fine nave, the Norman font, the shrine of Cantelupe, the tower lantern, and the modern screen.

Hereford arms

The Lady Chapel and the crypt are notable, as is the library with its chained books. The cathedral

possesses a unique map of the world, c. 1305.

Other buildings are the Old House (1621) in High Town, now a museum with local period furniture; the bishop's palace and the beautiful college of the vicars' choral; S. Ethelbert's and Coningsby hospitals, both old foundations: the latter being built in 1614 on the site of a building occupied by the Knights Hospitallers. The schools include the cathedral school. All Saints and S. Peter's are interesting churches. Hereford has a town hall, shire hall, art gallery, and public library and museum. There are only a few remains of the castle and of the town walls. The former is now represented by Castle Green, a public promenade with a memorial to Nelson. Every third year is held the Three Choirs' Festival (*q.v.*).

The chief industries are the making of cider, tanning, brewing, fruit canning and preserving, tile making, light steel, and a trade in agricultural produce. The corpn. owns the racecourse and markets.

Hereford owes its historical importance to its position on the Welsh border, while as a bishopric it dates from about 676. A castle was built for its protection and this was frequently assailed, the last occasion being during the Civil War. In the Middle Ages the citizens obtained the right to hold markets and fairs. They had a merchant guild and the city was soon a corporate town, also a centre of the trade in wool and leather. Weaving was carried on, gloves were made, and there was a mint. From 1295 to 1885 Hereford sent two members to parliament; until 1918 it sent one. It now gives its name to a county constituency. Pop. 30,510.

Hereford, EARL OF. English title. William Fitzosbern, one of the Norman leaders at Hastings, was made earl of Hereford in 1067. Between then and his death in 1071 he was chiefly defending the borders of England against the Welsh, and putting down rebels elsewhere. His younger son, Roger Fitzwilliam, succeeded to the earldom, but in 1075, for conspiring

against the Conqueror, he lost his lands and his freedom. Miles of Gloucester, a powerful baron in the reign of Stephen, and a stout partisan of the Empress Matilda, was made earl of Hereford in 1141.

When his last son died childless, his lands passed to his daughters, one of whom, Margaret, was the wife of Humphrey Bohun. Their grandson, Henry, was made earl of Hereford in 1199, and his descendants held the title until the last male Bohun died in 1373. In 1397 Henry, afterwards Henry IV, who had married an heiress of the Bohuns, was made duke of Hereford, and when he became king this title was merged in the crown.

Hereford, VISCOUNT. English title, the oldest of its kind, borne by the family of Devereux. Walter Devereux, 10th Baron Ferrers of Chartley, a title dating from 1299, was made Viscount Hereford in 1550. He had fought in France for Henry VIII. His grandson and successor was made earl of Essex and the viscounty was held by the earls until Robert, 3rd earl of Essex, died in 1646. The titles were then distributed and Sir Walter Devereux, a descendant of the 1st viscount, became Viscount Hereford. His descendants still hold the title, Robert Charles (b. 1865) having become 17th viscount in 1930.

Hereford. Hardy breed of cattle raised in Herefordshire and neighbouring counties. The body is red, while the face and mane, chest and abdomen are white; the legs are often white up to the hocks. Pure Herefords are of small esteem for dairying purposes, but they are fine beef-producers and are in favour on the cattle-ranches in Canada, Australia (especially Queensland), and the U.S.A. See Cattle.

Herefordshire. County of England. With an area of 842 sq. m., it is almost circular in shape. It is fairly level in the centre, but on its borders are hills, the Malverns in the E. and the Black Mountains in the S. The chief river is the Wye, which flows across the county. Other rivers, tributaries of the Wye, are the Lugg, Arrow, Dore, and Frome. The Teme is a tributary of the Severn. The county town is Hereford; other towns are Leominster, Ledbury, and Ross.

Hereford is an agricultural county, chiefly famous for cider, perry, and cattle, while the usual English cereals are grown. Orchards abound and hops are grown, and the sheep have a high valuation. The railways which serve the county all converge upon

Hereford. The cathedral, showing the west front, which was reconstructed 1900-05

Hereford. It is in the diocese of Hereford and the Oxford circuit: it is divided into 12 hundreds, and sends two members to parliament.

Having been a border county, Hereford contains some hundred castles, the chief being Richard's Castle, Clifford, Weobley, Hereford, Wilton, Goodrich, and Wigmore. There was a good deal of fighting here in the centuries after the Norman Conquest, and Hereford was an important place, much of the land being held by the lords marchers, families such as the Cliffords and Mortimers. As the

geographer, belonged to a family long established at Yatton, near Ross. The Elizabethan poet John Davies of Hereford took his name from his birthplace. John Phillips, author of *The Splendid Shilling*, is buried in the N. transept of Hereford cathedral. Nell Gwynne is said to have been born in Pipe Well Lane (later Gwynn Street), Hereford. Thomas Traherne came from the same city.

David Garrick was born at the Angel Inn, Hereford; Sarah Siddons passed her early life in the county, and her brother, Stephen

The King's England vol., ed. A. Mee, in 1938; English County, a survey, in 1947; Herefordshire, H. L. V. Fletcher, in 1948.

Herefordshire Regiment. Regiment of the British army formed when the Territorial Force, now the Territorial Army, was organized in 1907. It consists solely of territorial battalions, and for administrative purposes is attached to the corps of the King's Shropshire Light Infantry (q.v.). The king is colonel-in-chief. In the First Great War it served in Gallipoli, Palestine, and France. In the Second Great War it formed part of the 53rd (Welsh) Territorial division. Landing in Normandy in June, 1944, it saw hard fighting at Caen, Falaise, the Ardennes, the Reichswald, at the crossing of the Rhine, and during the sweep across Germany.

Herero or OVAHERERO. Negroid people in the S.W. Africa Protectorate. Situate S. of the allied agricultural Ovambo, they were formerly called Cattle Damaras, to distinguish them from the more primitive Hottentot-speaking Hill Damaras. Muscular, aggressive, skin-clad, they were the only purely pastoral Bantu-speaking people extant until they adopted some agriculture under missionary direction. They petitioned Sir Henry Barkly in 1872 for a British protectorate, but in 1884 their country was annexed by Germany.

In 1881, after a period of mutual tolerance, they waged ruthless warfare against the Hottentots; in 1903-06 they rebelled against the German colonial forces, at whose hands large numbers perished. The remainder, estimated

Herefordshire Regiment badge

Herefordshire. Map of this western English border county, famous for its agriculture and orchards, showing the course of the river Wye

district became more peaceable, fine churches and houses were built. Holme Lacy is perhaps the finest seat in the county. There was a monastery at Abbey Dore.

Good fishing is obtained. The pop. is 111,767, making the county one of the least densely peopled parts of England.

LITERARY ASSOCIATIONS. Richard Whittington, Lord Mayor of London, is supposed to have been born at Sollers Hope in the mid-14th century. Richard Hakluyt,

Kemble, was born at Ross. Sir Uvedale Price, writer on the picturesque, lived and died at Foxley in the parish of Yazor. Brinsop, the home of his wife's people, has a memorial window to Wordsworth. Elizabeth Browning passed much of her early life at Hope End, near Ledbury; in 1894 a clock tower was erected in the town to her memory. John Masefield was born at Ledbury.

The Victoria History of the co., ed. W. Page, appeared in 1908;

Herero. Warriors of this South-West African people

(1913) at 21,600, as compared with some 85,000 before the German occupation, were deprived of their cattle and gathered into reservations. Hereros today live in eight reserves, each having its chief, under the direction of a European commissioner. *See Africa.*

Hereroland. Country forming a portion of the S.W. Africa Protectorate, also called Damaland or Damaland. It lies between Namaqualand on the S. and Ovamboland on the N. The coastal region is waterless desert; behind this area is a mountainous district with peaks 8,500 ft. high, and beyond this there is good pastoral and agricultural country, extending towards the Kalahari Desert. The chief towns in Hereroland are Windhoek, Karibib, Rehoboth, Gobabis, Omaruru, and the port of Swakopmund. The only harbour is Walvis Bay, S. of Swakopmund.

Heresy (Gr. *hairesis*, choice). An opinion based on the choice of its holder and not on recognized authority. The word appears to have been first used in this sense at Alexandria, to denote the theological views of certain Jews, Pharisees, Sadducees, and Essenes. In the early Christian Church it came to mean an erroneous doctrine held by a body of people, but differing from that of the Church generally. Heresy differs entirely from unbelief or even scepticism. It believes and upholds Christian doctrine, but it misunderstands and misinterprets it. Similarly, it is not identical with schism, for a schismatic may be quite orthodox in his belief, while separating himself from the household of faith on some question of discipline.

Heresy is difficult to define, since it presupposes orthodoxy, which is a declaration of a point of view. A teacher who is orthodox from the Anglican standpoint may be an utter heretic from the R.C., and vice versa. A person merely mistaken in his views is not necessarily a heretic; the latter term implies a deliberate rejection of the orthodox belief. Only one who persists in his error after warning and instruction is to be regarded as a heretic, according to the N.T. rule, "A man that is an heretic after the first and second admonition reject" (Tit. 3, v. 10). The old canon law provides that only an error persistently maintained is to be counted heresy. The law of England declares to be heresy that which has been so determined heretofore by the authority of the Canonical Scriptures, or the four first general councils, or any of

them, or by any other general council, wherein the same was declared heresy by the express and plain words of the said Canonical Scriptures; or such as shall hereafter be determined to be heresy by the high court of parliament of this realm, with the assent of the clergy in their convocation.

Formerly in England bishops were required to punish heretics, and to notify to the lord high chancellor the preachers of heretical doctrine. In 1400 the statute *De Haeretico comburendo* was passed, and remained in force until it was partly repealed by Henry VIII, and finally abolished by Charles II. The last writs under this Act were issued in the ninth year of James I, when two preachers were burnt for heretical teaching. Ecclesiastical penalties for heresy now in force in Great Britain are deposition from office and excommunication in case of persistent obstinacy. The bishop of each diocese has the power to try charges of heresy brought against his clergy, and to punish them if found guilty.

It is remarkable that almost all the heretical movements in the Church can be traced back to a common origin in the Gnosticism which made its appearance in the days of the Apostles, and was denounced by them in their Epistles. Manichaeism, Arianism, Pelagianism, Montanism, Sabellianism, and the rest, are all either reflections of some aspect of Gnosticism or revulsions from it. *See Christianity; Dogma; Gnostics; Lollards.*

Hereward. An English hero, called the Wake. He held land in Lincolnshire, just before the time of William the Conqueror, and soon after the conquest became associated with those who disliked the Norman rule. He took part in an attack on Peterborough, and was the leader of those who resisted the king in the Isle of Ely. The story says he escaped when William made his way into the isle, in 1071, but nothing more is known of him. He is the hero of a romance by Kingsley, first published 1866.

Herford. Town of Germany, in Westphalia. It stands at the junction of the Werre and the Aa, 16 m. S.W. of Minden. It is a rly. junction, and has some interesting churches, one dating from the 12th cent. and two from the 13th. A Benedictine nunnery was founded in the 9th century, around which the town grew. The house before its end in 1803 was one of the richest in Germany. Herford was once a free city, but became part

of Brandenburg in 1647. It passed to Prussia in 1815. Pop. 35,940.

Hergenröther, JOSEPH VON (1824-90). German theologian and historian. He was born at Würzburg, Sept. 15, 1824, and educated at Rome and at Munich, where he became professor of church history in 1855. In his *anti-Janus* (Eng. trans. 1870), a reply to Döllinger's *Janus*, he upheld the infallibility of the pope. In 1868 he undertook the arrangements of the Vatican Council, and in 1879 was raised to the cardinalate, and was appointed curator of the Vatican archives. He wrote a *Life of Photius*, Patriarch of Constantinople; a *Universal Church History*; a *History of the Papal States since the Revolution*; and a treatise on Church and State.

Hergesheimer, JOSEPH (b. 1880). American novelist. Born at Philadelphia, Feb. 15, 1880, and

J. Hergesheimer,
American novelist

educated at the academy of fine arts there, he published his first book, *The Lay Anthony*, in 1914. His novels, notable for powerful characterization and subtly observed details, became as popular in Great Britain as in the U.S.A. They included *Java Head*, 1919; *Linda Condon*, 1919; *The Bright Shawl*, 1922; *From an Old House*, 1925; *Tampico*, 1926; *The Party Dress*, 1929; *Tropical Winter*, 1933; *The Foolscap Rose*, 1934. His autobiography, *The Presbyterian Child*, appeared in 1924.

Hergest, THE RED BOOK OF. A 14th century MS. in the library of Jesus College, Oxford, containing many old Welsh tales and poems. Its contents include a brief chronology from Adam to 1318, and a chronological history of the Saxons to 1376, also many of the poems ascribed to Taliesin (*see Mabinogion*; *Tahesin*). An exact copy was published by Rhys and Evans in 1887.

Heriot (A.S. *here*, army; *geatu*, apparel, equipment). The arms of a vassal which on his death were returned to his lord. Later it became customary to pay something in kind or in money in lieu of handing over the weapons, and this relief was sometimes called a heriot. Similarly it became the custom, where the manorial system prevailed, for the lord to take on death a beast or some other

portion of the property of a tenant, which was also called a heriot. See Feudalism; Relief.

Heriot, GEORGE (1563-1624). Founder of Heriot's Hospital, Edinburgh, Scotland. A goldsmith

George Heriot,
Scottish philan-
thropist
From an old print

by trade, he was appointed goldsmith for life to Queen Anne, wife of James VI, in 1597, and jeweller to the king in 1601. After James's accession to the throne of England he settled in London in 1603, and in 1609 took as his second wife a daughter of James Primrose, grandfather of the first earl of Rosebery. He left the residue of his property to found the hospital which bears his name. He died Feb. 12, 1624.

Heriot's Hospital. Formerly a charitable institution founded in Edinburgh by George Heriot, jeweller to James VI. A combination of Roman and Gothic architecture, erected 1628-59, 162 ft. square with an inner quadrangle 92 ft. square, it is said to have been designed by Inigo Jones. Of its 213 windows, only two are of one pattern. Cromwell used it as a barracks, but it reverted to its original use when Charles II ascended the throne. Extensively renovated in 1828, it is now a day school, managed by the Heriot Trust, which, from the funds derived from the investment of Heriot's bequest of £23,625 (now

of arts. It now has over 3,500 day and evening students in engineering, chemistry, building, printing, etc. An independent body of governors took office in 1928. Extensions were completed in 1935 and 1938. Named after Watt, inventor of the steam engine, to whom there is a statue in the front, it is supported partly by funds granted by the Heriot Trust.

Heri Rud. Alternative spelling of the name of the Afghan river also called Hari Rud (*q.v.*).

Herisau. Town of Switzerland, the largest in the canton of Appenzell, Outer Rhodes. It is 6 m. by rly. S.W. of St. Gall, and is a station on the Bodensee-Toggenburg rly. It stands on the Glatt torrent, at an alt. of 2,549 ft. There are thriving manufactures of machinery, cotton, and muslin, and an old (partly 11th century) church. In the vicinity are the goats' whey cure and chalybeate spring of Heinrichsbad. Herisau was governed by the abbots of St. Gall from the 9th to the 15th century, when the canton joined the Swiss Confederation. Pop. 12,789.

Heritable and Movable. Term used in Scots law to distinguish the part of a property which descends to the heir, the heritable property, and the part which goes to the next-of-kin, the movable property. As examples of the first may be cited land, leases, certain fixtures, etc., and of the second, household furniture, money, etc. Such a distinction applies not only in problems of succession but

Heriot-Watt College, Edinburgh. Technical college and school of arts erected in 1887
Card Inglis

Heritable Jurisdiction. Obsolete class of Scottish jurisdiction which granted certain families power to administer laws irrespective of the common law. These jurisdictions, of which nearly a hundred were in existence at one time, empowered their holders to punish by fines, imprisonment, or even death those who came within their province. Such arbitrary powers, exercised mainly by great Scottish chiefs, were a source of danger to the state, and were abolished 1748, properly constituted sheriffs being appointed in their place, and pecuniary compensation for the loss of these rights being paid to the amount of over £150,000. See Clan.

Heritable Security. In Scots law, name given to those securities corresponding to mortgages and charges on land in England. Under these securities a creditor is enabled, for example, to receive rents until the debt is discharged, no matter into whose possession the lands may pass. The principal heritable security is called the bond and disposition in security, and must be recorded in the register of sasines. When two securities compete, the one first registered takes precedence.

Heritor. Term used in Scots law for the owner in fee of heritable property in a parish. Until 1925 the parish church was vested in the heritors, who were bound to repair it. Then all church property was transferred to the Church itself, to be administered by the Church of Scotland general trustees.

Herkomer, SIR HUBERT VON (1849-1914). British painter. He was born at Waal, Bavaria, May 26, 1849, the son of a wood carver. In 1857 the family settled in England. In 1869 Herkomer became an exhibitor at the Dudley Gallery, and a contributor of sketches to

Heriot's Hospital, Edinburgh, from the south-west

greatly enhanced in value), contributes an annual payment also towards the Heriot-Watt College (*v.i.*) and has founded bursaries for government-aided schools in the city. Near the hospital is a fragment of the old city wall.

Heriot-Watt College. Technical college in Edinburgh, originally founded in 1821 as the school

between landlord and tenant, husband and wife, etc. Machinery that has been installed and fixed to the floor may be heritable. The ease with which such objects may be moved without damage to a building, and the reason for their addition to the building, determines the class into which they fall. See Fixture.

The Graphic, and in 1871 was elected to the Institute of Painters in Water Colour. He was elected A.R.A. in 1879, and R.A. in 1890.

In 1883 he founded a school of art at Bushey, Herts, and from 1885 to 1894 was Slade professor at Oxford. Among his works, which included many large sentimental "subject" pictures, are *Found*, 1885, in the Tate Gallery; *Lady in White* (portrait of Miss Grant), 1885; *A Zither Evening* with my Students, 1901; and a gigantic group of the town council of Waal. For many years his pronouncements on art topics, forceful rather than profound, were widely quoted. He was knighted in 1907. He died at Bushey, March 31, 1914. Consult his autobiography in *The Herkomers*, 1910.

Herm. One of the Channel Islands. It is 3 m. E. of Guernsey, and is $1\frac{1}{2}$ m. long by $\frac{1}{2}$ m. broad. It is noted for the extraordinary variety of shells on its beach. Before the First Great War the island was leased to a German company, but after being regained by the British it was sold to an English one, and later to the British government. In 1946 Guernsey purchased Herm from Great Britain for £15,000. There are frequent excursions from Guernsey in the summer. Pop. 30. See Channel Islands.

Hermæ. Small pillars, surmounted by a head, generally of Hermes. They were set up in large numbers in public places in the towns of ancient Greece. It was the alleged mutilation of the Hermæ of Athens perpetrated during a drunken frolic on the eve of the Athenian expedition to Sicily in 415 B.C. that led to the disgrace of Alcibiades.

Hermæ. The Hermæ of Alcmenes

Hermanaric or **ERMANARIC.** A king of the Ostrogoths. He founded a vast empire, consisting of a number of vassal states, the boundaries of which are said to have extended from the Don to the Theiss (Tisza) and from the Danube to the Baltic. Attacked by the Huns under Valamir (A.D. 375), Hermanaric, uncertain

of the attitude of his vassals and fearing defeat, threw himself upon his sword. According to another story, he had ordered the beautiful Swanhilda, his son's wife, to be torn to pieces by wild horses. Her death was avenged by her brothers who cut off Hermanaric's hands and feet and left him to die.

Hermandad (Span., brotherhood). The name given to various confederations of Spanish cities. They were originally formed in the 13th century, partly for maintaining law and order, and partly as a check upon the growing and autocratic power of the great nobles. The confederation provided protection to travellers by suitable police, brought criminals to justice, and in every way acted as the embodiment of the law. The hermandads became for a few years in the 15th century all powerful in Spain, every city becoming a member of one confederation covering all Spain. In the following century, however, their power declined rapidly, and soon it became extinct. Most powerful was the Santa Hermandad, or Holy Brotherhood, of the 14th and 15th centuries.

Hermaphrodite. A biological term for an organism in which the two sexes are combined. Some low species of animals, such as snails and earth-worms, and many plants, are normally hermaphrodite, possessing both male and female generative organs, which produce sperms and ova. These do not, however, necessarily, or even usually, fertilise each other, cross-fertilisation (see Fertilisation) being secured by the fact that the sperms and the ova in the same individual ripen at different periods.

No cases are known in human beings of true hermaphroditism, i.e. of a human being having both male and female organs present, and both functionally active. The term, however, is applied in medicine to those cases in which glands corresponding to the testes of the male and the ovaries of the female are found in one individual; also to the more common cases in which the sex of the individual is doubtful. The explanation of this more common form is to be found in the development of the external genital organs, hermaphrodites usually being individuals in whom a part has persisted which ought to have disappeared in the process of development. Rarely there occurs an individual with ovaries, and therefore a female, in whom the external appearances

are those of a male; and conversely. See Sex.

Hermaphroditus. In Greek mythology, son of Hermes and Aphrodite. The nymph of a fountain by Halicarnassus fell in love with the youth, and the two combined to form a being with the characteristics of both sexes.

Hermas. An early Christian writer. Supposed to have been a brother of Pope Pius I, he appears to have flourished in the first half of the 2nd century, when he wrote an allegorical work, called *The Shepherd*, giving a valuable picture of the state of Christianity at Rome during the period. The object of the book was to check worldliness, and it was at one time read in the churches; but it was finally set apart from the canonical Scriptures before the 4th century.

Hermeneutics (Gr. *hermeneutikē*, interpretation). The art or science of interpretation. It deals with the principles and general laws whereby the meaning of the written work of an author or the speech of an orator is established. The term is specially applied to the interpretation of the books of the Old and New Testament, as contrasted with *exegesis* (q.v.), commentary or practical exposition of the subject matter.

Hermes. In Greek mythology, son of Zeus. He was born in Mt. Cyllênē in Arcadia, and on the very day he was born stole some oxen belonging to Apollo. He became an adept in robbery, stealing the trident of Poseidon, the girdle of Aphrodite, and the sword of Arēs. These exploits apparently recommended him to Zeus, who took him to be his messenger and ambassador. In this capacity he executed many notable commissions, such as slaying the hundred-eyed Argus and carrying the infant Bacchus to the nymphs at Nysa.

He became the god of eloquence and the god of good fortune, and the patron of merchants, travellers, and also of thieves. One of his chief duties was to conduct the souls of the dead to the nether world. The invention of the lyre was attributed to Hermes. In art Hermes is represented as a handsome and finely proportioned youth, as in the famous statue by Praxiteles. Traditionally he wears the *petasus* or broad-brimmed hat, bears the *caduceus* or staff, which he got from Apollo in exchange for the lyre he invented, and has the winged sandals which enabled him to speed swiftly through the air. The Romans identified Hermes with Mercury (q.v.).

Hermes. British aircraft carrier, the first vessel specifically designed as such. Laid down in 1918, she was completed in 1923. Displacing 10,850 tons on a length of 598 ft. and maximum beam of 90 ft., she had a maximum speed of 25 knots, and mounted a main armament of six 5.5-in. dual-purpose guns and a secondary battery of 18 A.A. guns. She was manned by a crew of 664 and accommodated 15 aircraft. In the Second Great War, after service in the Mediterranean and the Indian Ocean, the *Hermes* was sunk 10 m. off Ceylon by Japanese dive-bombers, April, 1942.

Hermes was also the type name of a new Handley Page air liner introduced in 1947. The military version was named *Hastings*.

Hermesianax. Greek elegiac poet. A native of Colophon in Asia Minor, he flourished during the reign of Alexander the Great. One of the chief representatives of the Alexandrian school, he was the author of three books of elegiacs, named *Leontion* after his mistress, containing some pretty love stories, mythological and historical. They show considerable facility of invention, but the language is frequently artificial and affected.

Hermetic Books. Writings attributed to *Hermes Trismegistus* (*Hermes thrice-greatest*) the name by which the Egyptian god *Thoth* was known to the Greeks. He was considered the inventor of all the arts and sciences, especially the occult. The hermetic books, according to *Clement of Alexandria* 42 in number, were of a philosophical or scientific character, most of them probably the work of Alexandrian Platonists in the 2nd century A.D.

There is a complete translation of the extant works and fragments by L. Ménard, 1866, and of the *Poimander* by J. D. Chambers, 1882. *Trismegistus* was supposed to possess great skill in shutting up vessels with a magic seal, hence the modern expression "hermetically sealed" applied to closing a vessel or tube in such a manner that it is airtight.

Hermione. Leading female character in Shakespeare's tragedy, *A Winter's Tale*. Accused by her husband, the madly jealous *Leontes*, king of Sicily, of having committed adultery with *Polixenes*, king of Bohemia, and pronounced innocent of the offence by Apollo's oracle, she falls into a faint, which is reported to the king as fatal. She is reunited to him and to her daughter, *Perdita*, after

a lapse of 16 years; in a famous scene the king is asked to see a statue of his wife and discovers it to be *Hermione*.

Hermione. Ancient city of Greece, in the prov. of Argolis and Corinthia. Standing on the mainland N.W. of *Hydhra*, it was a prominent port with a double harbour, but the only remains extant are the scanty ruins of its temple of *Poseidon*. Founded by the *Dryopes*, it figured for a time as an independent state, but became subject to *Argos*. *Pron.* Her-mi-onee.

Hermit or **EREMITE** (Greek *erēmos*, solitary). Term applied to those who live in monastic communities, but especially to one living a solitary life in a cave or hut of his own construction, who has abandoned the world and its

term, at *Warkworth*, *Northumberland*, one on *St. Herbert's Island*, *Derwentwater*, and a retreat of *S. Francis*, near the convent of *S. Francisco*, *Assisi*, Italy. A 13th century stronghold near *Castleton*, on the Scottish border, was known as the *Hermitage*.

Hermitage, THE. Largest art museum in the U.S.S.R., ranking as one of the foremost museums in the world. It originated as the private collection of *Catherine II* towards the end of the 18th century. The buildings of the *Hermitage*, erected in the 1760s, by the French architect *Vallin de la Mothe*, adjoin the *Winter Palace* in *Leningrad*. An early catalogue enumerates some 2,500 paintings, and the collection also comprised engravings, ancient sculpture, jewels, coins, and medals; *objets d'art* in porcelain and gems forming the basis of a collection of applied art.

The *Hermitage*, still a private court collection, expanded mainly by purchases of pictures, and began to take on the aspect of a museum. New buildings were

The Hermitage, Leningrad. South entrance of Russia's leading museum and picture gallery

ways, and practises the severest austerities. *Paul of Thebes*, according to tradition the first hermit, is said to have fled to the desert during the persecution of *Decius* and to have lived in a grotto for 90 years. *Anthony*, *Hilarion*, *Arsenius*, and *Simeon Stylites* are among other famous hermits of history or legend. *See* *Anchorite*; *Asceticism*; *Laura*; *Monasticism*.

Hermit. Small group of islands in the western portion of the former German territory known as the *Bismarck Archipelago*, in the Pacific. They lie off the E. coast of *New Guinea*. A British naval force annexed the islands in Nov., 1914. *See* *Bismarck Archipelago*.

Hermitage. Retreat, cell, or habitation of a hermit or recluse. In modern usage the name is often applied to buildings that have nothing in common with the original meaning, e.g. to a palace of *Catherine II* in *Leningrad*; to a fashionable garden resort in *Moscow*; and to a palace near *Baireuth*, *Bavaria*, once occupied by *Frederick the Great*. There was a *Hermitage*, in the old sense of the

raised 1839-50 by the German architect *Klentze*. The museum was opened to the public in 1852. In 1884 a department of medieval and renaissance art was started. At the Revolution most of the exhibits were temporarily removed to *Moscow*. Private collections nationalised thereafter were also added to the museum; in 1923 the *Stieglitz* museum of applied art was incorporated.

The department of Western European Art is rich in examples of 16th and 17th century Italian painting, 17th century Spanish, Flemish, and Dutch, and 17th and 18th century French masters. The collection of drawings amounts to some 20,000; of engravings, to about 250,000. There are collections of porcelain; 18th century English and French silver; snuff-boxes; 16th century Italian majolica; Moorish faience; 16th century French enamels; 11th to 16th century ecclesiastical art. The department of antiques, besides having a fine collection of Roman portrait busts, vases, and terra-cotta, is notable for a unique

collection of Scythian relics and Greek jewellery. The collection of coins and medals (some 300,000) is one of the finest in the world. The Eastern section has Sassanid silver, Persian and Caucasian bronzes, ceramics, and carpets.

Hermitage. French wine grown near Valence, in the Drôme. Red Hermitage resembles Beaune in colour and strength, and claret in elegance; the white, of which little is made, is similar but superior to Chablis. Beaujolais, often classed with Hermitage, is grown on the northern hills of the Rhône dept.

Hermit Crab (*Pagurus* and *Eupagurus*). Popular name for a group of small crabs which take up their abode in the empty shells of whelks and other gastropods or in living sponges. This habit is due to the fact that the hinder half of the body is not protected by a

Hermionthis. City of ancient Egypt. It is close to the present Armant or Erment, 459 m. S. of Cairo and 9 m. from Luxor. Here are the remains of a temple of Isis and numerous other ruins. The city was called On, or, to distinguish it from other places of the same name, the Southern On, or Per-Mont (House of Mont), whence came the Greek name Hermionthis.

Hermopolis. Greek name of the ancient Egyptian city of Khmunu. About 4 m. inland from Roda, and 176 m. by rly. S. of Cairo, Hermopolis was the chief centre of the worship of Thoth, the god of writing and science. Papyrus rolls with writing in Amharic have been found near.

Hermopolis (Greek *Hermoupolis*, city of Hermes). Seaport of Greece, capital of the barren island of Syros (Syra) and the dept. of the Cyclades. Situated on the E.

shore of the island, in a sheltered bay, it consists of an old and a modern well-built town, and is an administrative centre. It has a good harbour, an arsenal, high school, seminary, theatre, etc. The

seat of a Greek and an R.C. bishop, it has a shipbuilding industry, and manufactures "Turkish delight," cottons, leather, flour, and glass. The exports include emery, valonia (acorn cups containing a high percentage of tannin), sponges, and tobacco. Pop. 21,150.

Hermosa (Sp., beautiful). Pass or mule track over the Andes between San Juan in Argentina and the Chilean town of Ovalle in Coquimbo.

Hermosillo. City of Mexico, capital of the state of Sonora. It stands on the river Sonora, 89 m. by rly. N. of Guaymas, and is a busy trade centre, particularly

with the U.S.A. Silver and copper are mined; bullion, hides, ores, and fruits are exported, the orange groves supplying the U.S.A. before its own fruit ripens. Sugar is grown, and flour milling and distilling are carried on. The city contains a cathedral, a mint, and a library. Pop. 30,000.

Hernani, ou L'HONNEUR CASTELLAN (Castilian honour). Five-act tragedy in verse by Victor Hugo. It was produced at the Comédie Française, Paris, Feb. 25, 1830, and ran until June 18. It was a departure from traditional literary form, liberated the French stage from the thralldom of the classical unities associated with the school of Racine, marked the beginning of the romantic movement of 1830-50, and provoked at the outset extraordinary opposition which resulted in at least one fatal duel.

It is notable for the vigour of its verse, the effectiveness of its stage situations, and the long soliloquy of Charles V before the tomb of Charlemagne. The titular hero is a mysterious bandit who at the moment of his marriage dies by his own hand in order to keep his word to his enemy. Upon Hugo's work Verdi founded his opera *Ernani*, produced at Venice, 1844; when given in Paris, 1846, it was named *Il Proscritto*. Fechter and Edwin Booth acted in an English adaptation, and this, like Verdi's opera, was in four acts. Sarah Bernhardt made one of her many successes in the rôle of the heroine Doña Sol. See Hugo, V.

Hernani. Town of Spain, in the Basque prov. of Guipuzcoa. It stands on the river Urumea, 8 m. S.E. of San Sebastian. The chief features are several palaces and a church celebrated for its wood carvings. Hernani suffered much in the Carlist wars of the 19th century. It makes cider, and nearby iron mines afford employment for many of its 6,160 inhabitants.

Herne Bay. Urban district and holiday resort of Kent, England. It is 12 m. W. of Margate and 62 m. by railway from London. Visited in summer for its sands and bracing air, its attractions include 7 m. of sea front; one of the longest pleasure piers in the U.K., with pavilion, concert party, sports, etc.; theatre, bandstand, and facilities for dancing. In the district is Reculver (*q.v.*) with Roman remains, site of the Roman station of Regulbium, and $1\frac{1}{2}$ m. inland is the village of Herne, with the E.E. church of S. Martin. Pop. 17,500.

Hermit Crab. Specimen of *Pagurus* Bernhardus

hard carapace and needs shelter against its enemies. The abdomen is provided with a pair of grasping appendages by which the crab clings tightly to the shell, from which it is not easily extracted. Eleven species are found around the British coasts. See Crab.

Hermogenes of TARSUS (2nd century A.D.). Greek rhetorician. He taught in the reign of Marcus Aurelius at Rome, where he was considered a youthful prodigy. He was the author of four extant rhetorical treatises, on disputed points of law, invention of arguments, different styles, best uses of material, and of some rhetorical exercises. *Pron.* Her-moj-eneez.

Hermon. Mt. of Syria. It forms the S. extremity of the Anti-Lebanon range and is now known as the Jebel esh Sheikh. Often mentioned in the Bible, it is 9,380 ft. high, and on its slopes are the ruins of a great temple of Baal. Little Mt. Hermon range lies about 24 m. S.E. of Acre.

Hermon, the mountain at the southern extremity of the Anti-Lebanon range, Syria

Herne Bay, Kent. The sea front looking east towards the Clock Tower

Frith

Herne Hill. Residential dist. of London, S.E. It lies between Brixton on the W. and Dulwich on the E., and has a station on the electric rly. It is in the boroughs of Camberwell and Lambeth. At No. 28 and No. 30, Herne Hill, the road leading N. from the rly. station to join Denmark Hill, lived Ruskin; both houses have been replaced by flats. Between Burbage Road and Dulwich are Herne Hill athletic grounds. The name Herne Hill is believed to be derived from Heron Hill.

Herne the Hunter. Horned apparition which was supposed to haunt a certain oak in Windsor Forest in the time of Elizabeth. The legend is used to Falstaff's undoing in *The Merry Wives of Windsor*, and forms a notable feature in Harrison Ainsworth's romance *Windsor Castle*. Herne's Oak, said to have been six hundred years old, was blown down, Aug. 31, 1863. A young oak was planted on the spot by Queen Victoria, Sept. 12. *Consult* Windsor, the Castle of our Kings, A. Goddard, 1911.

Hernia or **RUPTURE.** Latin name given to the protrusion of an organ or part of an organ through an opening in the cavity which normally contains it. After an injury to the head, for example, the brain may protrude through the scalp, forming a hernia of the brain. The term, however, is commonly applied to the protrusion of organs in the abdominal cavity through weakened spots in the abdominal wall.

Congenital defects or weakness of the abdominal wall are frequent predisposing causes. The actual rupture, which occurs later, may be due to frequent strain upon the wall, resulting from occupations entailing lifting heavy weights; weakening of the abdominal wall, such as may follow childbirth; direct injury to the wall; or weakness in the neighbourhood of a scar following an abdominal operation.

A hernia consists of a sac formed by the peritoneum or lining membrane which covers the abdominal organs, and of the contents of the sac, most frequently a part of the intestine. The abdominal wall is pushed in front of the protruding mass, and the sac becomes adherent to the surrounding parts.

In inguinal hernia, part of the abdominal contents, usually a portion of the intestine or membranaceous covering of the intestine, has passed through the inguinal canal, a narrow channel towards the inner end of the groin, beneath the skin, through which the spermatic cord and blood-vessels pass down to the testicle. In the early stages, a slight swelling only can be felt in the region of the inguinal canal, which enlarges when the patient coughs. In the later stages, the swelling is larger, and may eventually extend into the scrotum.

A reducible hernia is one in which the protruded mass may be replaced in the abdominal cavity by gentle manipulation. A femoral hernia is less common, in which the protrusion passes through the crural canal, and appears as a rounded swelling on the inner side of the thigh near its junction with the abdomen. An umbilical hernia consists of the protrusion of the abdominal contents through a weakened scar of the umbilicus or navel. Ventral hernia is a protrusion through some other spot in the abdominal wall.

The treatment is either palliative or radical, i.e. by operation. Palliative treatment consists in wearing a truss, i.e. an appliance consisting of a pad which presses upon and closes the aperture in the abdominal wall, and is kept in position by a spring belt passing round the body. A truss should be well fitted, and the contents of the hernia should never be allowed to come down. In some cases, this treatment may effect a permanent cure after the truss has been worn for a year or two.

The operative treatment consists essentially in sewing together the tissues which form the abdominal wall, so as to reduce or close the aperture through which the hernia is protruded.

A hernia may become inflamed, obstructed, or strangulated. The symptoms of an inflamed hernia

are pain, tenderness, and swelling, while the skin over the hernia may be hot and congested. Fever may be present, but the constitutional symptoms are not so severe as in strangulation.

In an obstructed hernia, the onward passage of material through the intestine is prevented. The symptoms are usually constipation, nausea, and vomiting. The hernia becomes irreducible and may pass on to strangulation. In a strangulated hernia, the blood-vessels become pressed upon, so that the flow of blood through them is obstructed. This may lead to gangrene of the mass. The symptoms are severe pain, with signs of shock. The patient feels faint, the pulse is slow and weak, the temperature may be subnormal, and the skin covered with cold sweat. Strangulation urgently demands surgical treatment. *See* Truss.

Hernici. People of ancient Italy akin to the Sabines, living in the Apennine country. Continual warfare was waged between them and the Romans, by whom they were finally subdued in 306 B.C. Their chief stronghold was Anagnia. *See* Anagni.

Hernösand. Seaport of Sweden, capital of the län or govt. of Västernorrland. It stands on Hernö island, in the estuary of the Ängerman river, and is connected by bridges with the mainland, 423 m. by rly. N. of Stockholm. It has a good harbour, a cathedral, a school of navigation, and a technical school. It was the first European town to adopt electric lighting. Formerly a staple town, it has trade in linen, sulphite, fish, iron ore, and lumber. An old city, it has suffered severely at the hands of the Russians, notably in 1710, 1714, and 1721. Pop. 13,316.

Hero. General term applied to one who performed great deeds in the mythical ages of Greece. One or other of the parents of heroes was frequently a god or goddess, and sometimes after their death heroes became gods themselves. Among the best known heroes of Greek mythology are Hercules, who accomplished the famous Twelve Labours; Theseus, who slew the Minotaur; Perseus, who cut off the Gorgon's head and rescued Andromeda from the sea-monster; and Achilles and Hector, the champions of the Greeks and Trojans respectively at the siege of Troy. The name was also given to the oekists, founder of colonies or cities, who received semi-divine honours after death, and to famous personages such as Leonidas, the hero of Thermopylae.

Hero. In Greek legend, priestess of Aphrodite at Sestos, on the shore of the Hellespont opposite Abydos. See Leander.

Hero of ALEXANDRIA. Alexandrian mathematician. His exact date is unknown, but his reputation has survived for several memorable discoveries in mathematics and science. His most remarkable discovery was that of the well-known formula for the area of a triangle in terms of its sides and the semiperimeter. It is also certain that he knew elementary trigonometry and the solution of quadratic equations in algebra.

Hero was responsible for a number of mechanical inventions, the chief of which is the fountain that bears his name. This was an automatic fountain working by means of air pressure. He is also credited with the description of a small stationary steam-engine. The fragments that remain of his works place him as being the leading scientist of his age.

Herod (74-4 B.C.). King of Judaea, called the Great. The son of Antipater and grandson of Antipas, governor of Idumaea, he was appointed ruler of Galilee at the age of 25, and afterwards of Coele-syria. When Palestine was invaded by the Parthians to restore Antigonos to the throne of his father Aristobulus, Herod escaped to Rome, where Antony and Octavian, with the sanction of the senate, made him king of Judaea. He returned to Palestine in 39 B.C. and captured Jerusalem in 37, in which year he married Mariamne, the Asmonean princess, as his second wife. His first difficulties were with the hostile Sadducean and Pharisaic parties, and throughout his reign (37-4) he was opposed by the enmity of his wife's family. After the battle of Actium (31) Herod was confirmed in his position and territory by Octavian, whom he visited at Rhodes, expecting to be executed owing to the help he gave Antony. From that time on he governed Palestine on behalf of Rome.

Herod built fortresses, established new towns, rebuilt the temple at Jerusalem, organized games, and encouraged Greek writers and teachers to settle in his kingdom. His brother Pheroras and his sister Salômê plotted against his sons by Mariamne, which led Herod to have them assassinated. Mariamne he had put to death owing to jealousy. His last years were embittered by family feuds and plots arising out of the enthusiasm of the people for the Asmonean house. His eldest son, Antipater, he had put to death ten days

before his own death. The story of his massacre of the innocents is generally discredited nowadays. The picture of Herod as an inhuman monster, as given by Josephus, is also open to serious criticism.

Bibliography. Life and Times of Herod the Great, W. Willett, 1860; Antiquities of the Jews, F. Josephus, rev. ed. D. S. Margoliouth, 1906; The Jewish People in the Time of Jesus Christ, E. Schürer, Eng. trans. 1890; The History of Herod, J. Vickers, rev. ed. 1901; Herod, J. S. Minkin, 1936.

Herod. Tragedy written by Stephen Phillips and produced Oct. 31, 1900, at Her Majesty's. The play deals with the murder of Mariamne's brother Aristobulus by order of Herod, with the successful plot formed by Herod's mother and sister to bring about the execution of Mariamne, and with Herod's unavailing grief and remorse for her death. Beerbohm Tree played Herod, and Maud Jeffries Mariamne.

Herod Agrippa I (d. A.D. 44). Son of Aristobulus and Berenice and grandson of Herod the Great. He was made king by Caligula and governor of Judaea and Samaria by Claudius. See Agrippa.

Herod Agrippa II (d. A.D. 100). Son of Herod Agrippa I. He was the last of the Herodians (*q.v.*). Paul appeared before him in A.D. 60. See Agrippa.

Herod Antipas. Son of Herod the Great by Malthacê, a Samaritan. By his father's will he was made tetrarch or governor of Galilee and Peraea. He built for his capital a city on the Sea of Galilee which, to ingratiate him-

self with the Roman emperor, he called Tiberias. His first wife was a daughter of Aretas, an Arabian prince called in 2 Cor. 11 king of Damascus; but, becoming enamoured of Herodias (*q.v.*), wife of his half-brother Herod Philip, a private citizen in Rome, he divorced his own wife and married her. By Herodias he had a daughter, Salômê. Antipas was denounced by John the Baptist (*q.v.*), who was first imprisoned and then, at the instigation of Herodias and Salômê, executed.

Jesus was examined before Herod, whose conduct on this occasion led to his reconciliation with Pilate. Defeated in battle by Aretas, A.D. 36, Antipas went to Rome c. 38-40, at the instance of Herodias, to secure the title of king, but was accused of treason and condemned by Caligula to perpetual banishment to Lugdunum (Lyons), whither Herodias accompanied him. He died in exile. Consult Matt. 14; Mark 6 and 8; Luke 3, 13, and 23; Antiquities of the Jews, F. Josephus, rev. ed. D. S. Margoliouth, 1906.

Herodas OR HERONDAS (3rd cent. B.C.). Greek writer of mimiambi, i.e. mimes or humorous sketches written in iambic metre. He was a native of Cos and a younger contemporary of Theocritus. In 1890 an Egyptian papyrus was found at Fayum, containing six of his mimes in a more or less perfect state. These short, dramatic pieces are written in the Ionic dialect and in the *scæzon*, or "halting" iambic metre, in which a spondee (two long syllables) takes the place of an iambus (short and long syllable) in the

Herod Antipas. S. John the Baptist bound by order of the Governor of Galilee. Fresco by Andrea del Sarto, in the cloister of the Scalzo, Florence

last foot. A unique specimen of their kind, they consist of scenes from everyday life in dialogue form, in some parts reminiscent of Theocritus. The characters introduced are sometimes unpleasant, sometimes of a homely type. *Consult A Realist of the Ægean*, H. Sharply, 1906.

Herodians. Term applied to the family of Herods. Idumæan by descent and Jewish by faith, they sought the favour of Rome. They included Herod the Great, Herod Antipas, Herod Philip I, Herod Philip II, Herod Agrippa I and Herod Agrippa II. The term is applied also to those who, for various reasons, supported the political aspirations of the Herods and sided with the Pharisees and Sadducees against Jesus. *See* Matt. 22; Mark 3 and 12.

Herodian OR **HERODIANOS** (c. A.D. 170-240). Roman historian. A Greek by birth, he appears to have resided chiefly in Rome. His history, written in his native tongue and still extant, embraces the period from the death of Marcus Aurelius to the reign of Gordian III (187-238). In spite of geographical and chronological inaccuracies and lack of political insight, it is a lively and generally trustworthy account of contemporary events and forms a valuable supplement to the work of Dion Cassius (q.v.).

Herodias. Sister of Agrippa I. She left her first husband Herod Philip I and married his half-brother Herod Antipas (q.v.). This act brought down upon the two the condemnation of John the Baptist, whose head, at Herodias's request, was demanded and granted to her daughter Salômê, and involved Antipas in a disastrous war with his first wife's father. Herodias's ambition finally brought about the ruin of Antipas, with whom, however, she decided to go into exile. *See* Matt. 14; Mark 6.

Herodotus (c. 484-424 B.C.). Greek historian, commonly called the father of history. Born at Halicarnassus in Caria, in Asia Minor, a city which, though peopled by Dorian Greeks, was under Persian rule, Herodotus was technically a Persian subject by birth. The first half of his life was spent in travel. He lived some time at Samos, where he learned the Ionic dialect in which he wrote his history. About 446 B.C. he came to Athens, where he became intimate with the poet Sophocles. By the time he reached middle life he had travelled in Persia, Egypt, Italy, and Sicily, and had visited even

the N. shores of the Black Sea. During his travels Herodotus was diligently collecting materials for his history, but where the work was actually written is not known.

Its theme is the great struggle between the Persians and the Greeks, which was still fresh in the memory of the Hellenic world. The first five of the nine books are taken up with a sketch of the rise of the Persian empire, in which the author gives a history of Lydia as a preliminary, with historical and descriptive digressions on Egypt and other countries with which the Persians came into contact. The last four books deal with the actual clash of arms between Persians and Greeks, giving the immortal stories of Marathon, Thermopylae, and Salamis, and ending with the taking of Sestos by the Greeks in 478. The work is thus virtually a sketch of the history of the world, as then known, with geographical, archaeological, and other digressions.

Like the Greek tragedians, Herodotus held the belief that overweening arrogance among mortals slowly but surely brings in its train the punishment of heaven, and this idea runs all through the history. The work, as a whole, is one of the most fascinating ever written, perhaps the most enthralling section being the second book, which deals with the history and civilization of Egypt. With his clear and simple style, Herodotus is a master of narrative prose. He was the first to write history according to a plan or scheme, those that went before him being mere chroniclers.

His veracity has been impeached, but although his history contains much that is palpably untrue, Herodotus wrote in good faith. There are excellent translations of the history by G. Rawlinson and by G. C. Macaulay. *Consult* Herodotus, T. R. Glover, 1924.

Heroes and Hero Worship. Volume of lectures on Heroes, Hero-Worship, and the Heroic in History by Thomas Carlyle, 1841. The six lectures, delivered at Willis's Rooms, London, in May, 1840, comprise some of the best and most characteristic of Carlyle's vigorous and stimulating work. They deal successively with the hero as divinity, prophet, poet, man of letters, and king, taking as typical examples Odin, Mahomet,

Dante, Shakespeare, Luther, Knox, Johnson, Rousseau, Burns, Cromwell, and Napoleon.

Herodotus, Greek historian
Bust in Naples Museum

Heroic Play. Form of dramatic tragedy set up in the second half of the 17th century, of which Dryden was the chief, but not the first, exponent. The tragic drama had degenerated from the greatness of Elizabethan time, and an attempt was made to re-establish it more or less closely on French models, both in choice of themes and in the use of rhymed couplets.

In his essay *Of Heroic Plays*, Dryden credited his predecessor and collaborator, Sir William D'Avenant, with having originated them. He declared that the heroic play should be an imitation in little of an heroic poem (i.e. epic), and that love and valour ought to be its subjects.

The chief attempts of Dryden himself in this direction were *Tyrannic Love* or *the Royal Martyr*, 1669; *Almanzor* and *Almahide* or *the Conquest of Granada*, 1670, in which he came nearest to justifying his theory as to the suitability of his form; and *Aureng-Zebe* or *the Great Mogul*, 1675. The heroic play was made the satiric theme of *The Rehearsal*, 1671, by Buckingham and others.

Heroic Verse. Name given to the form of verse used in epic poetry, which deals with the life and deeds of heroes. In Greek and Latin, as in the *Iliad* and the *Aeneid*, the verse is hexameter. In English it is rhymed iambic pentameter, used by Dryden, and by Pope in *The Rape of the Lock*. The French adopted as the sole recognized form for dramatic and epic poetry the twelve-syllabled rhymed measure, with alternate masculine and feminine, single and double, rhymes, as in Corneille and Racine. In Italy the recognized form is the *Ottava Rima* (q.v.).

Heroin OR **DIAMORPHINE HYDROCHLORIDE.** Hydrochloride of the diacetyl derivative of morphine (q.v.), obtained by acting on morphine with acetic anhydride. Apart from relieving pain, it is used in medicine to stop coughing, especially in cases of phthisis and pleurisy. A drug of addiction it is scheduled as a poison under the Pharmacy and Poison Act, 1933.

Hérolé, LOUIS JOSEPH FERNAND (1791-1833). French composer. Born in Paris, Jan. 28, 1791,

he studied music at the conservatoire there, and his first successful opera, *Les Rosières*, 1817, was notable for the originality of its orchestration. His most famous opera, *Zampa*, 1831, made him universally known; the overture is retained in the concert repertory. Hérold also wrote ballets, and composed for the piano. He died Jan. 19, 1833.

Heron (*Ardea*). Name given to the birds of the various genera of the family Ardeidae, which includes the herons proper and the bitterns. They are closely related to the storks and ibises, and include some 70 species distributed in all parts of the world, but specially numerous in tropical marshes and swamps. They are all carnivorous, feeding mainly on fish, frogs, and insects. All have long legs, long necks, and a long, straight, pointed beak. Most are bluish grey and white.

The European or common heron (*A. cinerea*) is a well-known inhabitant of Great Britain, and was formerly an object of the chase, being preserved for hawking. It still breeds in many parts of the country, usually in parks, where it is more or less protected. It is easily recognized by its crane-like form and the crest of long, blackish feathers at the back of its head. The plumage is grey on the upper parts, with greyish white below; the forehead, sides of the face, and front feathers of the breast being white. It is about 3 ft. in length, and the pointed beak is yellow.

The common heron feeds upon fish, frogs, snakes, and young mammals and birds, visiting the margins of streams and lakes at nightfall and early in the morning. It nests in colonies or heronries in the tops of tall trees, the nest being large, flat, and made of sticks with a lining of grass. There are several heronries in England.

Four other species occur occasionally in the British Isles. The night heron (*Nycticorax*) is found occasionally in spring and autumn. It is about 22 ins. in length, greenish brown on the back, with slate wings and tail and white underparts. The buff-backed heron (*Ardeola ibis*) is an extremely rare visitor from

S. Europe. Its colour is white, with the exception of the rusty buff head, neck, and breast. The squacco heron (*Ardeola ralloides*) is another variety, only 18 ins. long, with reddish buff neck and back, the rest of the plumage being mainly white. The purple heron (*Ardea purpurea*), common in Holland, is sometimes seen in spring and autumn. Ranging in length from 30 to 36 ins., it has its crown of the head and crest purple; the rest of the plumage is mainly grey and brown.

Heroult Furnace. One of the original designs of direct series electric arc furnaces, still widely used for steel smelting. In the early furnaces, two carbon electrodes were inserted through the roof and were suspended at some distance from the metal to be melted; as melting proceeded the electrodes were lowered so as to keep them a constant distance from the molten metal. The current jumped the gap from one electrode to the bath, forming an arc, and then

back from the bath to the other electrode, completing the circuit.

Modern furnaces, employing three-phase power, need three electrodes, suitably connected to the transformer. In some large furnaces, holding 100 tons or more of molten metal, the bath is made elliptical and two sets of electrodes are used. Usually the furnace is arranged so that it may be tilted for pouring and the electrodes may be raised well up to facilitate recharging. The carbon electrodes may be of the Soderberg type, the furnace heat carrying out the baking. Heroult furnaces are used for alloy steels, irons, and ferroalloys. See Electric Furnace.

Herpes (Gr. *herpein*, to creep). Herpes simplex is an acute eruption of vesicles or blebs on the skin. The angles of the mouth, buttocks, nipples, and genital organs are most frequently affected. The cause is some filter-passing virus. Attacks may occur apparently spontaneously or in the course of pneumonia, influenza, and other diseases. Exposure to cold is sometimes a precipitating cause. The appearance of the vesicles may be preceded by a sensation of

heat or tingling. The vesicles develop in a few hours and are about the size of a pin's head. They dry up and disappear without leaving a scar in about ten days. Treatment consists in bathing the affected areas with boric acid lotion and covering it with a little starch and zinc oxide powder. Brief local application of X-rays tends to prevent recurrence.

Herpes zoster (Gr., girdle), or shingles, is an acute eruption of vesicles occupying the area supplied by a nerve. It results from an acute infection of the posterior root ganglion of such a nerve by a filter-passing virus. Beyond co-incidence this virus is in some way allied to that of chicken-pox. Outbreaks of the two complaints synchronise and the infections seem interchangeable. An attack of shingles is sometimes preceded by slight fever. Pain may be severe or slight. The blebs appear in a few hours along the course of a nerve and persist for about ten days, usually disappearing without leaving a scar. Protection of the affected part by cotton wool, and dusting with starch and zinc oxide powder, is the only treatment, with large doses of Vitamin B.

Herrenhaus. German word meaning house of lords. It was applied to assemblies of persons of rank who did not owe their seats to popular election, such as existed in Austria and Prussia before 1918.

Herrenhausen. A Palace just outside the town of Hanover, Germany, formerly the residence of the electors and kings of Hanover. An avenue of limes, 1½ m. long and 120 yds. wide, leads from the inner town to the palace. Built 1665 and completed by the first elector, Ernest Augustus, the father of George I and the husband of the electress Sophia, who died here, it was a favourite residence of George I, and remained a royal palace until the fall of the dynasty in 1866. Around it are gardens laid out in the French style, and in the grounds are an orangery, a theatre, and some fine fountains. It was damaged in the Second Great War.

Herrenvolk (Ger., master race). Title claimed by the Nazis for the German, and in general for the Nordic, peoples, as against the "slave" or "common herd" races. The term is derived from misinterpreted teachings of Nietzsche, who in *Wille zur Macht* (Will to Power) explains the different standard of morals between the ancient civilizations and those affected by Jewish, Christian,

Heron. Specimen of the European *Ardea cinerea*

and Socialist tenets as being due to "master" and "slave" consciousness respectively.

Herrera, ANTONIO DE (1559-1625). Spanish historian. After studying in Spain and Italy, he entered the service of Philip II, who made him one of his historiographers. His chief work is his *History of the Deeds of the Castilians in the Islands of the Pacific* (1601-15). He also wrote on the succession question in England and Scotland in the time of Mary Stuart, and a general history of the world in the time of Philip II. He died March 29, 1625.

Herrera, FRANCISCO DE (1576-1656). Spanish painter. Born at Seville, he studied under Luis Fernandez. He was a pioneer of the realistic movement in Spain, and had Velazquez among his pupils. Of intractable disposition, he once suffered imprisonment for illegal coining, and neither his children nor his pupils were able to live with him. At 74 he went to Madrid, where he worked for the court, under Velazquez's protection, until his death in that city. One may cite his four paintings of the Life of S. Martin in the church of that saint, and his Last Judgement in S. Bernard's, Seville.

Herreschoff Furnace. Type of furnace used for roasting ores as a preliminary to smelting. There are a number of superimposed hearths, the ore being fed into the top one, across which it is moved by a rotating, air-cooled rabble, fixed to a central shaft. The ore drops from hearth to hearth and is ultimately removed from the bottom. See *Calcination*; *Roasting*.

Herrick, ROBERT (1591-1674). English poet. Son of a goldsmith and born in London, he was bapt-

Robert Herrick,
English poet

From the frontispiece
of his "Hesperides"

tized at the church of S. Vedast, Foster Lane, Aug. 24, 1591. It is thought that he was educated at Westminster School, on leaving which he was apprenticed to his uncle, a goldsmith. After graduating at Cambridge, where he was a student 1614-20, first at S. John's College and then at Trinity Hall, he returned to London, joined the Jonson circle, and in 1629 became vicar of Dean Prior, near Ashburton, Devon, where his wants were attended to by an old servant.

Prudence Baldwin (the "Prue" of his poems). Ejected by the Puritans in 1647, he returned to his living in 1662, being buried at Dean Prior, Oct. 15, 1674. He had tried, not unsuccessfully, to be both the urban, witty companion and the quiet country pastor.

Described by Swinburne as "the greatest song-writer—as surely as Shakespeare is the greatest dramatist—ever born of English race," Herrick lapsed at times into indeelicacy and is not immune from monotony, but at their best his *Hesperides* and *Noble Numbers* are exceedingly beautiful. Among faultless and well loved lyrics are those *To Anthea*; *To Dianeme*; *To Daffodils*; *Cherry Ripe*; and the lines beginning *Gather ye rosebuds*. Herrick could sound a sincere devotional note, e.g. in *A Thanksgiving to God for his House*; *Litany to the Holy Spirit*. An excellent edition of his poems is that by A. W. Pollard, 1891 and 1898. *A Life*, by F. W. Moorman, appeared in 1910; and there is a charming portrait in Rose Macaulay's novel, *They Were Defeated*, 1932.

Herries Chronicle. Fictional saga by Hugh Walpole. This series of novels concerning the fortunes of the squirearchical family of Herries is set in Cumberland, and extends from the mid-17th century to the 20th. Beginning with *Rogue Herries*, 1930, the series included *Judith Paris*, 1931; *The Fortress*, 1932; and *Vanessa*, 1933. The *Bright Pavilions*, 1940, dealt with an Elizabethan ancestor of the family.

Herring (*Clupea harengus*). Fish belonging to the same genus as the sprat and pilchard. It is found near land in the N. Atlantic, but not in the Mediterranean. The genus contains about 60 species, most of them available as food for man. The common herring is always found in shoals which swim near the surface of the sea, and are constantly moving from place to place following their food. The result is that the herring fishery is somewhat uncertain, a good fishing ground being often temporarily deserted.

The herring feeds mainly on minute crustaceans, called collectively zooplankton, filtering them out of the water by means of the gill-rakers at the side of the throat, which act as a kind of sieve like the baleen of the whale. It also eats small worms and the eggs and fry of its own and other species of fish. It avoids dense concentration of minute plant life called

Herring. Specimen of the common herring found in the Atlantic and northern seas

phytoplankton; therefore biologists can to some extent predict the position of herring by analysing the plankton. When alarmed, the herring will sometimes leap out of the water and be carried several feet through the air. There are two spawning seasons, summer and winter; but the winter spawners belong to a different race from the others. The eggs do not float on the surface, but adhere to the stones and weeds at the bottom of comparatively shallow water.

The summer eggs are deposited at some distance from the shore, but the winter ones are usually shed in brackish water about the mouths of rivers, and may even be found attached to the leaves of fresh-water plants. The average number of eggs deposited by the female is 30,000. These hatch in from ten days to a month, according to temperature, and the young fish take two to three years to become adult. Around the British coasts 12 ins. is a usual length for a full-grown fish, but in Iceland specimens 17 ins. in length are often taken.

Economically the herring is an important food fish, owing to its nutritious qualities and its great abundance. It is specially numerous in the North Sea and along the E. coast of Scotland, and the fishery is carried on by boats from most of the countries of N. Europe, especially Great Britain, Germany, and Holland. It is chiefly captured in the drift net, the seine being used in waters such as the sea lochs of Scotland. See *Fisheries*; *Trawling*.

Herring Industry Board. Established under the Herring Industry Act, 1935, and reconstituted by that of 1938. It is empowered by these and the Herring Industry Act, 1944, to reorganize, develop, and regulate the industry. The board administers schemes of grants and loans for the provision of fishing boats, nets, and gear; promotes research and experiments in processing and quick freezing of herrings; and controls production and export marketing.

Herrings, BATTLE OF THE. Fought Feb. 12, 1429, between the English and the French, the latter aided by their Scottish allies. The

English were besieging Orléans and a small force under Sir John Fastolf was carrying provisions from Paris to the army there. This was attacked by the French and Scots at Rouvray. The English formed a hollow square, the provision wagons being placed in the centre, and the enemy were beaten off. The battle was so called because the wagons contained quantities of salted fish for use during Lent. *See Hundred Years' War.*

Herriot, Édouard (b. 1872). French statesman and author. Born at Troyes, July 5, 1872, and edu-

Edouard Herriot,
French statesman
and author

cated at the Ecole Normale Supérieure, he taught literature at Nantes and at Lyons, where he became a professor at the university. A Radical in politics, he was elected mayor of Lyons in 1905, and held

the post almost continuously except during the Second Great War. He entered the senate in 1912, and in 1916 became minister of public works under Briand.

In 1924 he became premier and foreign minister. Always a protagonist of European cooperation, he made concessions to Germany and gave recognition to Soviet Russia; but in 1925 his government was defeated over plans for stabilising the franc, Herriot becoming president of the chamber. In July, 1926, he formed a government from the Left, but was forced to resign within a few days. He became minister of education in Poincaré's coalition cabinet, 1926-28, resigning his chairmanship of the Radicals. In 1932 he was premier for the third time, but for only six months. Under Doumergue and Flaudin he was minister of state, and in 1936 again president of the chamber. He opposed Pétain and Laval after the fall of France, and was interned at Vittel. Transferred to Germany, he was liberated in April, 1945. In 1947 he again became president of the chamber and mayor of Lyons, and in 1948 was chosen chairman of the Five-Power (Western Union) committee.

Herriot's great literary talent was overshadowed by his political career. His published works include *Mme. Récamier et Ses Amis*, 1904; *Agir*, 1917; *Créer*, 1919; *La Russie Nouvelle*, 1922; *Life of Beethoven*, 1925; *Eastward from*

Paris, 1934; *The Wellsprings of Liberty*, 1940. In 1947 he was elected to the Academy.

Herschel, Sir John Frederick William (1792-1871). A British astronomer. Born March 7, 1792,

he was the only son of Sir William Herschel. Taking his degree as senior wrangler at Cambridge, he began a systematic study of the heavens in 1822, the results of

which he presented to the Royal Society eleven years later. The whole northern hemisphere came under his survey, and he added over 500 nebulae and clusters of stars to those already known, as well as nearly 4,000 double stars. In 1834 he established an observatory at the Cape of Good Hope, in order to survey the southern hemisphere. Here his work continued for four years, the results being published in 1847.

Returning to England in 1838 he was created a baronet, received numerous honours from universities, was secretary of the Royal Society, and thrice president of the Royal Astronomical Society. Herschel wrote an *Outline of Astronomy*, 1849, and contributed articles on the theory of light and sound, and on the study of natural philosophy, to current encyclopedias. In 1850 he was appointed master of the mint, resigning 1855. He died May 11, 1871. *Consult The Herschels and Modern Astronomy*, A. Clerke, 1895.

Herschel, Lucretia Caroline (1750-1848). Hanoverian astronomer. Sister of Sir William

Caroline Herschel,
astronomer
After M. G. Tieleman

Herschel, she was born March 16, 1750, at Hanover, and came to England in 1772, becoming assistant to her brother. On his appointment as private astronomer to George III, she was given an annual salary of £50, and carried out independent observations under his instructions. An indefatigable worker, she discovered five new comets and a number of nebulae and star clusters; she added 561 stars to the catalogue published by Flamsteed. On the death of her

brother she returned to Hanover, where she died Jan. 9, 1848.

Herschel, Sir William (1738-1822). Hanoverian astronomer. Born at Hanover, Nov. 15, 1738, he came to England in 1757, earning a poor livelihood by teaching music. In his spare time he studied astronomy, and in 1774 he made his first telescope. His success with this instrument encouraged him, and throughout his life he was concerned with the manufacture and improvement of telescopes. But his reputation will remain connected with his discovery of the planet Uranus in 1781. This brought many rewards, including the Copley medal and an F.R.S.

In 1782 Herschel was appointed private astronomer to George III. Soon honours were showered on him by British and foreign universities and scientific societies for his brilliant astronomical researches. He contributed

nearly 70 papers to the *Philosophical Transactions*, all showing a remarkable power of reasoning. His systematic search of the heavens not only resulted in

William Herschel
After J. Russell, R.A.

the discovery of a large number of double stars, and of Uranus, but also of two new satellites of Saturn.

To Herschel is due the first computation of the period of rotation of Saturn, that of the motions of binary stars, and the path of the solar system through the heavens. He increased the number of known nebulae from 180 up to 2,500. He demonstrated the disk structure of the Milky Way system. He was ably assisted in these researches by his sister Caroline. As a physicist, he demonstrated his discovery of infra-red rays to the Royal Society in 1800, when he showed that the spectrum of the sun is continued beyond the visible red into a region where, though invisible, it exerts a maximum heating effect. He died Aug. 25, 1822, at Slough. *See Astronomy; consult also Life and Works*, J. L. E. Dreyer, 1912; *The Herschel Chronicle*, ed. C. A. Lubbock, 1933.

Herschell, Farrer Herschell, 1st Baron (1837-99). British lawyer and politician. Born Nov. 2, 1837, he went to University College, London, was called to the bar from Lincoln's Inn in 1860, and in 1872 was made Q.C. In 1874 he was Liberal M.P. for Durham, and

in 1880 became solicitor-general. In 1886 he was made lord chancellor and created a baron. He retained the woolsack only a few months, after which he was one of Gladstone's followers. He again became lord chancellor 1892-95. In 1898 he represented Great Britain in the arbitration over the boundary of Venezuela, and he was still in the U.S.A. when he died March 1, 1899, at Washington. His many honours included the chancellorship of London university. His grandson Rognvald (b. Sept. 13, 1923) became 3rd baron in 1929.

Hertford. Mun. bor., market and co. town of Hertfordshire, England. It stands on the Lea,

Hertford arms

24 m. N. of London, and has two railway stations. It is picturesquely situated, and contains a large shire hall, and a county hall, opened in (1939), corn exchange, and public library. Of its churches, All Saints, 1895, replaced an earlier structure destroyed by fire in 1891; S. Andrew's is on the site of a building founded in pre-Norman times; and the R.C. church occupies the site of a Benedictine priory founded in the time of William I. Here are Christ's Hospital girls' school, and a boys' grammar school replacing that founded by Richard Hale in 1617, the buildings of which house a secondary school.

The castle, built by Edward the Elder in 905, and several times reconstructed, now serves as municipal offices. It incorporates parts of the ancient stronghold in which Isabella, widow of Edward II, died in 1358. Henry IV, Elizabeth, and other sovereigns resided in the castle, which was taken by the parliamentary forces during the Civil War. Haileybury College is 2 m. S.E., and Panshanger, the former seat of Lord

Desborough, is 2 m. N.W. Hertford's history goes back to the time of King Alfred. It has a large agricultural trade, and brewing, malting, printing, tanning, and brush making industries. It gives its name to a co. div. returning one M.P. Market day, Sat. Pop. est. 14,190. Pron. Har'-ford.

Hertford, FRANCIS CHARLES SEYMOUR CONWAY, 3RD MARQUESS OF (1777-1842). British peer. Born March 11, 1777, he was the only son of the 2nd marquess and his wife, the daughter of the last Viscount Irvine, from whom came much of his great wealth. Educated at Oxford, he was an M.P.

Hertford

After Laurence

before succeeding to the title in 1822. He lived the life of a man of pleasure, and is the original of the marquess of Steyne in *Vanity Fair* and of Lord Monmouth in *Coningsby*. He died in London, March 1, 1842. The marquess married an heiress, Maria Fagniani, daughter of G. A. Selwyn, and had two sons. Richard Seymour Conway (1800-70), the elder, who became the 4th marquess, was a collector of pictures and works of art, which now form part of the Wallace Collection (*q.v.*).

Hertford College. College of the university of Oxford. It dates from about 1283, when Elias de

Hertford College arms

Hertford founded a hall for students known as Hart or Hertford Hall. It became a college in 1740, but was dissolved in 1805, and later its buildings and property were acquired by Magdalen Hall. In its turn Magdalen Hall was dissolved in 1874, when a new charter was obtained establishing Hertford as its successor and giving it all the privileges enjoyed by other colleges. T. C. Baring, M.P., provided funds for its endowment. The society consists of a principal,

fellows, and scholars, and its buildings, mainly modern, are at the corner of Broad Street and New College Lane and in Holywell St. C. J. Fox was up at Hertford.

Hertford House. A London mansion associated with the Seymour family. In Manchester Square, W., it was begun in 1776 by the 4th duke of Manchester, after whom it was first named. In 1788 it became the Spanish embassy; later it passed to the 2nd marquess of Hertford, whose second wife was the attraction that drew George IV to become an almost daily visitor. Under the patronage of Lady Hertford, Theodore Hook here made his entry into fashionable life.

Hertford House. Mansion in Manchester Square, London, in which is housed the Wallace Collection

The 4th marquess bequeathed the house and his famous art treasures to Sir Richard Wallace, who reconstructed the building for their accommodation in 1871-75, and whose widow in 1897 bequeathed them, with additions, to the nation. Hertford House was bought by parliament and opened as a public art gallery in 1900. In both Great Wars the collection was removed for safety. It housed exhibitions arranged by the British Council in the Second Great War, when it suffered damage by German bombs. See Wallace Collection.

Hertfordshire or HERTS. One of the "home counties" of England, it has an area of 632 sq. m. and is bounded N. by Cambridgeshire, S. by Middlesex, E. by Essex, and S.W. by Bucks. Picturesque, especially on the W., its winding lanes and woods, manor houses and old churches, make it a favourite with lovers of rural scenery. The chief geological formations are the Cretaceous and the Tertiary. Much of the S. is London clay, characteristic of the Thames Valley. Along the N. border high ground runs in from Cambridgeshire, part of the chalk range of E. England, a Branch of the Chiltern Hills; the county is generally undulating.

Of its 17 small streams the most important are the Colne and Lea.

Hertford College, Oxford. The quadrangle seen from the chapel, with the hall on the left

Frith

The former rises between Hatfield and St. Albans, is joined by the Ver near Watford, and the Gade and Chess at Rickmansworth, and then enters Middlesex. The Lea, the largest river of the county, rises in Bedfordshire and enters Essex at Waltham Abbey.

Hertfordshire arms

Nearly parallel with the Lea is the artificial New River which, fed by springs near Hertford, brings water to London. The Grand Union Canal passes through Rickmansworth, Boxmoor, and Berkhamsted.

Agriculture, market gardening, and the cultivation of fruit for the London market are leading pursuits; permanent pasture abounds and hay is largely produced. There are no minerals of commercial importance and no manufactures on an extensive scale. The industries include straw plaiting, paper making, malting, brewing; lace, silk, and agricultural machinery are produced.

Main line rlys. from Euston, St. Pancras, and King's Cross, also the Met. rly., serve the county, supplemented by the Green Line services. Of the roads the chief are the Old North Road, the Great North Road, and the Dunstable Road; and there are remains of

three Roman roads, Watling Street, Ermine Street, and the Icknield Way. The chief towns are Hertford (co. town), St. Albans (a cathedral city), Watford, Hitchin, Barnet, Berkhamsted, Hatfield, Bishop's Stortford, and Ware. The co. includes Welwyn Garden City, and Letchworth, also a garden city. Stevenage and Hemel Hempstead were scheduled as new towns after the Second Great War.

The county was once part of Mercia and of Essex. St. Albans, as Verulamium, was a Roman city. William I held a council at Berkhamsted, where, as at Hertford, are remains of an old castle. Henry III had a palace at King's Langley. Elizabeth lived at Ashridge Park, was a prisoner at Hatfield, the historic home of the Cecils, and had a hunting lodge at Hunsdon. The only English pope, Adrian IV, was born at Abbots Langley. Rye House, near Hoddesdon, is associated with a plot to murder Charles II and James, duke of York. St. Albans and Barnet were the scenes of historic battles of the Wars of the Roses. Six M.P.s are elected, and one for Watford. Pop. 401,206.

LITERARY ASSOCIATIONS. Bacon lived at Gorhambury, took his title of viscount from St. Albans, and was buried in the church of S. Michael. Chaucer was a clerk at Berkhamsted Castle. With St.

Albans are associated the names of Matthew Paris, Sir John Mandeville, Dr. Cotton; it is the background of Dickens's novel, *Bleak House*. Chapman lived at Hitchin; Young, author of *Night Thoughts*, was rector of Welwyn, and is buried there. Cowper was born at Berkhamsted, and introduced Ware in the poem about John Gilpin. Isaac Watts lived at Theobalds; Bulwer Lytton at Knebworth. With Lamb are associated Mackery End and Widdow. Hoddesdon has memories of Prior and Izaak Walton. George Bernard Shaw's residence, Ayot St. Lawrence, is near Welwyn. At Radlett lived Émile Cammaerts, Belgian author. The Victoria History of the co. appeared in 4 vols., 1912-14.

Hertfordshire Regiment. Regiment of the British Army formed when the Territorial Force, now the Territorial Army, was organized in 1907. It consists of territorial battalions only. For administrative purposes it forms part of the corps of the Bedfordshire and Hertfordshire Regiment. In the First Great War it served in France throughout; in the Second Great War it had battalions in Africa, Italy, France, and Malaya.

Hertha. A Teutonic goddess. Called also Nerthus, she was the goddess of fertility. Our scanty information about her worship is derived from Tacitus, who, in his *Germania*, gives a brief account of certain mysterious ceremonies which took place on an unknown island, usually at night, her image and vestments being bathed in the lake after the rites. Her statue was veiled.

's Hertogenbosch or BOIS-LE-DUC (Dutch and Fr., duke's wood). Town of the Netherlands, capital of N. Brabant. It stands at the confluence of the Aa with the Dommel, 33 m. S.S.E. of Utrecht, and is a rly. junction and well served by canals. Its splendid Gothic cathedral of S. John, dating from the middle of the 15th century, was built on the site of an 11th century Romanesque structure, and is noted for rich ornamentation, lofty nave with double aisles, and beautiful choir and pulpit. The Raadhuis, in the Great Market, contains fine paintings, and the provincial museum houses antiquities. Other buildings of note are the government buildings, court house, episcopal palace, arsenal, barracks, and grammar school. The town was strongly fortified until its defences were razed in 1876.

Hertfordshire. Map of the county to the north of Middlesex, famous for its agriculture and market gardening

Industries are concerned with machine shops, glass, carriages, bicycles, iron foundries, ship-building, cigars, linen, printing. The town is a market for cattle and agricultural and dairy products. The duke commemorated by the name is probably Godfrey III of Brabant, who c. 1070 built a hunting castle in the woods. Hendrik I granted municipal privileges in 1184. During the Second Great War's Hertogenbosch was a key point in the German defence system in the Netherlands. It was liberated by troops of the 2nd British army, Oct. 26, 1944. No buildings of historical importance were destroyed. Pop. 52,143.

Hertwig, OSCAR (1849-1922). German anatomist and embryologist. Born at Friedberg, April 21, 1849, he studied medicine at Jena and Bonn, and in 1878 became professor of anatomy at Jena. In 1888 he was appointed director of the institute of anatomy and biology in Berlin. Hertwig was the first biologist to demonstrate that fertilisation is basically the fusion of two nuclei: that of the ovum and that of the sperm. His other principal contributions to biology were his investigations into the malformations of vertebrate embryos called *spina bifida*; the germ-layer theory; and the parallelism in gametogenesis in the two sexes of ascaris. Hertwig resigned his post at Berlin in 1921 and died Oct. 26, 1922. He was a voluminous writer on embryology, his more important works being: *Contributions to the Knowledge of Fertilisation*, 1876; *Text Book of the Evolutionary History of Men and Invertebrate Animals*, 1888; *Cells and Tissues*, 1898; *Studies in Animalculae*; *World Biology*, 1920.

Hertz, GUSTAV (b. 1887). German physicist. Born in Hamburg, July 22, 1887, a nephew of Heinrich Hertz, he studied electricity, and in 1920 joined the firm of Philips at Eindhoven, Holland. In 1925 he became a professor at the university of Halle, and in 1928 at the technical high school at Charlottenburg. In 1926 the Nobel prize for physics was awarded to him, jointly with James Franck, for

's Hertogenbosch. The cathedral of St. John, an 11th century foundation, rebuilt 1418-50

their experiments on the production of the emission of spectral lines through electronic bombardment, which laid the foundations of the proof of the quantum theory of light.

Hertz, HEINRICH RUDOLF (1857-94). German physicist. Born at Hamburg, Feb. 22, 1857, his name will always be associated with the discovery of the Hertizian waves of wireless telegraphy. In 1880 he became assistant to Helmholtz at the Berlin Institute, where he carried

Heinrich Hertz, German physicist

out a series of researches on electric discharge in gases. On his appointment to the professorship of physics in 1885 at Karlsruhe Polytechnic, inspired by the electro-magnetic theories of Clerk-Maxwell, Hertz began the study of electro-magnetic waves.

Hertz showed the refraction, diffraction, and polarisation of the electric waves and their correspondence with those of light and heat. The practical results he obtained, particulars of which he published in 1887, were no less brilliant than were the mathematical researches of Clerk-Maxwell. Their importance cannot be overestimated, for upon them has been based the whole of wireless communication. Till his death, Jan. 1, 1894, Hertz continued to publish regularly papers on his remarkable discoveries, and many were translated into English in 1896 by D. E. Jones and G. A. Schott. See *Wireless Telegraphy*.

Hertz, HENRIK (1798-1870). Danish poet and dramatist. Educated in Copenhagen, where he

was born Aug. 25, 1798, he began to study law, but his early writings—among them *The Letters of a Ghost*, 1830, brought him into such prominence that, after a journey on the Continent at the public expense, he settled down to literature with a subsidy from the state and the title of professor. Among his best known poetical dramas are *Svend Dyring's House*, 1837, and *King René's Daughter*, 1845, Eng. trans. Theodore Martin, 1850, new ed. 1894. His *Poems* appeared 1851-62, and *Collected Dramatic Works*, 1854-73. He died Feb. 25, 1870.

Hertz, JOSEPH HERMAN (1872-1946). Chief rabbi of the British Empire. Hertz was born at Reber-

Joseph H. Hertz, Jewish rabbi

rin, Slovakia, then in Hungary, Sept. 25, 1872, and emigrated as a child to New York, where he was educated at Columbia university and the Jewish theological seminary of America. He became a rabbi of Syracuse, New York, in 1894 and at Johannesburg in 1898, being expelled by President Kruger for his pro-British sympathies and for advocating the removal of the religious disabilities of Jews and R.C.s in the Transvaal republic. Hertz was professor of philosophy at the Transvaal university college, 1906-08, and became a rabbi in New York City, 1912. From 1913 he was chief rabbi of the United Hebrew Congregations of the British Empire. The idea for a Jewish national home in Palestine owed much to his championship. He published *A Book of Jewish Thoughts*, and numerous works on Jewish and educational subjects. Hertz was made C.H. in 1943, and died in London, Jan. 14, 1946.

Hertzog, JAMES BARRY MUNIK (1866-1942). South African statesman. Hertzog was born of Dutch-German stock at Wellington, Cape Colony, April 3, 1866, and educated at Victoria College, Stellenbosch, and Amsterdam

J. B. M. Hertzog, S. African statesman

university, Netherlands. One of the Boer generals in the S. African war, 1899-1902, he afterwards became an ardent and doughty champion of

Boer nationalism. He was a member of the first Union cabinet, 1910-12, but his animosity against Botha and General Smuts and his anti-British views led to his retirement. In 1915 he was elected leader of the Nationalist party, becoming prime minister in 1924.

During 1933 a rapprochement was effected between Hertzog and Smuts, which led to the formation of the United South African Party, 1934, and of a national government in which the former continued as prime minister until he resigned in Sept., 1939, when parliament approved Smuts's motion in favour of active participation in the Second Great War. He resigned his seat and the leadership of his party in 1940, and died Nov. 21, 1942. *Consult* General Hertzog, L. E. Neame, 1930.

Hertzsprung, Ejnar (b. 1873). Danish astronomer. Born Oct. 8, 1873, at Copenhagen, he was educated at St. Petersburg (Leningrad) and Leipzig, and held posts in the observatories of Copenhagen, Göttingen, Potsdam, and Leyden. He found how to measure the intrinsic brightness of stars from their directly observable features—spectra, colours, and proper motions. He shares with the American astronomer Russell the discovery in 1905 that stars as a whole can be classified as giants or dwarfs. In 1913 he first measured great stellar distances by using the periods of variable stars; in 1922 he deduced stellar radii from their surface temperatures. He was awarded the gold medal of the Royal Astronomical Society in 1929.

Heruli or **ERULI**. Ancient Germanic people. Their original home is said to have been in the Cimbric Chersonese (Jutland). They are first mentioned in the 3rd century A.D. as inhabiting the steppes near the Black Sea and the Danube, in alliance with the Goths. A warlike people, they were ready to serve any leader as mercenaries. In 476 they assisted Odoacer (Odavacar), called king of the Heruli, to overthrow the West Roman empire and to establish himself as ruler of its territories. After his downfall, the Heruli dispersed and, after many vicissitudes of fortune, disappeared from history in the early part of the 6th century. They are said to have adhered to paganism longer than any other Germanic people.

Hervas y Panduro, Lorenzo (1735-1809). Spanish philologist. Born May 10, 1735, he became a Jesuit, and held professorships at

Madrid and Murcia. On the expulsion of the Jesuits from Spain in 1767, he settled in Italy, where he produced his great work, *Idea of the Universe*, 21 vols., 1778-92. He also wrote *Catalogue of the known languages*, and other works on philology, to which study he gave a great impetus, especially in Italy. He was librarian of the Quirinal Palace, Rome, from 1803 until his death, Aug. 24, 1809.

Hervey, John Hervey, Baron (1696-1743). English politician and author. Son of John Hervey, earl of Bristol, he was born Oct. 15, 1696, belonging to the family of whom it was said that God made men, women, and Herveys, so notable was their pride.

He was educated at Westminster and Clare Hall, Cambridge. In 1725 he entered Parliament, attaching himself to Sir Robert Walpole. The confidence of Queen Caroline gave him political importance, both before and after he became lord privy seal in 1740.

In 1733 he was made a baron. He did not live long enough to inherit his father's earldom, dying Aug. 5, 1743. Three of his sons became in turn earl of Bristol. As a writer, Hervey is chiefly known for his *Memoirs of the Court of George II*, which show the king and his son Frederick, prince of Wales, in a very unfavourable light. They were edited by J. W. Croker, 1848; by R. Sedgwick, 1931. Hervey was satirised by Pope, to whom he replied with almost equal bitterness. *See* Bristol, Marquess of.

Hervey, James (1714-58). English clergyman and devotional writer. Born at Hardington, near Northampton, February 26, 1714, he was educated at the local grammar school and at Lincoln College, Oxford, where he was greatly influenced by John Wesley.

Later he attached himself to the Calvinists. He succeeded to his father's livings at Weston Favell and Collingtree, was remarkable for his benevolence, and died on Dec. 25, 1758.

James Hervey,
English clergyman
From an engraving

1st Baron Hervey
After Vanloo

His works include *Meditations and Contemplations*, 1746-47, which contain *Meditations among the Tombs*, turgid and unnatural in style, but once extraordinarily popular; *Contemplation on the Night*, 1747; and *Dialogues between Theron and Aspasio*, 1755, which led to a controversy on the nature of faith with Robert Sandeman (q.v.). Hervey contended that justification by faith meant appropriation; Sandeman, that the vital thing was not the manner of believing, but the matter of belief. *Consult* *Life and Letters*, T. Birch, 1782; *Works*, 6 vols., 1769.

Hervey Archipelago. Group of islands in the Pacific Ocean, also known as Cook Islands, under which name it is described in this Encyclopedia.

Hervey Bay. Bay on the coast of S. Queensland, Australia. The east side is formed by Great Sandy Island, one of the sandy islands which interfere with coastal navigation. On the west side is the sugar and cattle-rearing area, of which the commercial centre is the small port of Bundaberg, which is situated at the beginning of the bay, here some 50 m. across. At the head of the bay in the south a narrow sea channel separates Gt. Sandy Island from the district of Maryborough.

Hervieu, Paul Ernest (1857-1915). A French dramatist and novelist. Born at Neuilly-sur-Seine, Nov. 2,

1857, he was educated for the law, and called to the bar in 1877. Later he entered the diplomatic service, but in 1881 he resigned and thenceforward devoted himself to journalism and literature. His first novel, *Diogène-le-Chien*, 1882, was followed by a collection of journalistic narratives, *La Bêtise Parisienne*, 1884; *L'Inconnu*, 1887; *Flirt*, 1890; *Peints par Eux-Mêmes*, 1893; and *L'Armature*, 1895.

In his stories he showed close knowledge of life, and charming literary fancy. Having established himself as a novelist, he won fresh and greater fame as a dramatist, his principal plays being *Les Paroles Restent*, 1892; *Les Tenailles*, 1895; *La Course du Flambeau*, and *L'Énigme*, 1901, produced in English as *Cæsar's Wife*, in the following year; *Théroigne de Méricourt*,

1902; *Le Dédale*, perhaps his best, 1903; *Le Réveil*, 1905; *Connais-Toi*, 1909. He was elected to the French Academy in 1900. His collected plays were published in 3 vols., 1900-04. He died Oct. 25, 1915.

Herzegovina. District of S.E. Europe. It is a part of the federative republic of Bosnia-Herzegovina, one of the six, forming, with two autonomous provinces, the federal republic of Yugoslavia, and lies on the N.W. of the Balkan peninsula. It consists of mountains rising to a height of 8,000 ft., and forming part of the Dinaric Alps, with high forested valleys and cultivable plateaux in between. It is watered by the Narenta, on which is its chief town, Mostar. It produces barley, tobacco, timber, excellent wine, and much fruit. Cattle, goats, and pigs are raised in considerable quantities. Minerals are abundant, but little worked. Its area is 3,697 sq. m.; pop. about 430,000.

During the Roman period it was at various times included in Illyria, Pannonia, and Dalmatia. After its conquest by the Turks it was a Turkish province. As a result of the Berlin Congress, July, 1878, it was handed over, with Bosnia, to Austria, who in 1908 annexed both and formed them into the provincial government of Bosnia-Herzegovina. In 1918-19, after the fall of the Austrian Empire, Herzegovina became a portion of the new kingdom of the Serbs, Croats, and Slovenes. *See* Austria; Yugoslavia.

Herzen, ALEXANDER IVANOVICH (1812-70). Russian publicist. Born at Moscow, the illegitimate son of a rich nobleman, Yakolev, he was exiled at the age of 23 to Siberia on account of his advanced views, and again in 1841 to Novgorod.

Herzen's father leaving him a fortune, he removed to Paris, whence he was banished, and went to Nice. In 1850 he published, in German, *Vom Andern Ufer* (From the other shore), in which he proclaimed the end of the old European system and its regeneration by the Russian community. Then came, in French, *Du Développement des Idées Révolutionnaires en Russie*, 1851, Eng. trans. 1853.

Herzen removed to London, where he set up a Russian printing press and started a revolutionary periodical, *The Polar Star*, and on July 1, 1857, began to issue a weekly revolutionary journal, *Kolokol* (The Bell), which was smuggled into Russia in hundreds of thousands. In 1859 he

published, in English, *Memoirs of Catherine II and the Princess Dachkov*. He died in Paris, Jan. 21, 1870. *Consult* My Past and Thoughts, Eng. trans. 1924-28.

Herzl, THEODOR (1860-1904). Zionist leader. Born May 2, 1860, at Budapest, he was a journalist in Vienna. His *Der Judenstaat*, 1895 (Eng. trans., 1896), inspired the Zionist cause. He died in 1904 and was buried in Vienna. His remains were reinterred, 1949, near Jerusalem, at a spot renamed Herzl Hill. *See* Zionism.

Heseltine, PHILIP. British composer better known by his pseudonym Peter Warlock (q.v.).

Heshbon. Ancient city of Palestine. It stood at the N.E. corner of the Dead Sea, and was the capital of Sihon, king of the Amorites, and was captured by the Israelites on their way to Canaan (Num. 21, v. 25).

Hesiod (fl. c. 700 B.C.). Greek didactic poet. He lived at Ascra, at the foot of Mt. Helicon, in Boeotia, his father having been an immigrant from Kyme, in Asia Minor. Details of his life are obscure, but there is reason to believe that he lost his patrimony in a lawsuit against his brother, Perses, who bribed the judge. As a result of this, Hesiod removed to the neighbourhood of the Gulf of Corinth, where he spent the rest of his life, until, according to legend, he was murdered.

A farmer by profession, one of his poems, *Works and Days*, is a didactic poem, part of which is virtually a manual of agriculture, to which Virgil is much indebted. *Works and Days*, however, is a composite poem, another part of it consisting of a sort of moral essay on the dignity of labour, and the injustice of rulers and judges.

Hesiod's other surviving poem, *Theogony*, is an account of the creation of the world, and a history of the gods and demi-gods. The two poems *The Shield of Heracles* and the *Contest of Homer and Hesiod* are not genuine. In later ages Hesiod was much used as a school book. The best edition of the text with English notes is that of Paley, 1883, and there are prose translations in Bohn's *Classical Library*, by J. Banks, and by A. W. Mair, 1908.

Hesionē. In Greek mythology, daughter of Laomedon, king of Troy. Poseidon and Apollo, offended by Laomedon, sent a monster to whom yearly a maiden had to be sacrificed. Hesionē was about to suffer this fate when she was rescued by Hercules, who slew the monster with his club.

Hercules had been promised a team of beautiful horses as a reward, but Laomedon refused to keep his promise. Hercules therefore killed the deceitful king, set Priam on the throne in his stead, and married Hesionē to his friend Telamon. *Pron.* Hē-sie-once.

Hesperia (Gr. *Hesperos*, evening star). Term applied by the Greek poets to Italy as being the western land. Roman poets sometimes applied the name to Spain.

Hesperides. In Greek mythology, nymphs who guarded the golden apples of Hera (q.v.). Their gardens were variously fixed in the Far West by different legends. The quest of three of these golden apples was one of the twelve labours of Hercules. The name was chosen by Herrick (q.v.) as title for a series of his poems.

Hesperornis (Gr. *hespera*, evening, west; *ornis*, bird). One of the fossil birds of the Cretaceous system. It is remarkable for possessing teeth, and so showing the descent of birds from reptiles. Only extremely rudimentary remains have been found in Kansas, but from these have been deduced the facts that the bird was 3 ft. tall, and probably a strong swimmer, though unable to fly. *See* Odontornithes.

Hesperos. In Greek mythology, the name of the evening star. The Romans spelt the name Hesperus, in which form it is usually met in English. *See* Venus.

Hess. Name of a family of German artists. Karl Ernst Christoph Hess (1755-1828) was a painter and engraver. His son, Peter von Hess, was born at Düsseldorf, July 29, 1792, and, having served in the Bavarian army during 1813-15, became well known as a painter of battle scenes. Examples of his spirited work were to be found at Berlin and Munich. He died at Munich, April 4, 1871. Heinrich Maria von Hess was born on April 19, 1798, studied in Munich and Rome, and became director of the Munich galleries. His work was chiefly of a religious character, notable examples being decorations in the chapel of All Saints and the basilica at Munich. He died there on March 29, 1863. Another brother, Karl (1801-74), was an attractive painter of Alpine landscapes and genre pictures, some of which were in the National Gallery, Berlin.

Hess, DAME MYRA (b. 1890). British pianist. Born in London, Feb. 25, 1890, she became a pupil of Tobias Matthay, and made her

début in 1907. She later made several world tours, and became one of the most popular pianists of her generation in Great Britain and the U.S.A. A fine interpreter of Bach, Scarlatti, and Mozart, she organized lunch-time concerts at the National Gallery, London, 1939-46, for which enterprise she was created D.B.E. in 1941.

Myra Hess,
British pianist

Hess, VICTOR FRANZ (b. 1883). Austrian physicist. He was born at Waldstein, June 24, 1883. After being a lecturer at Vienna university, 1909-20, he became director of the research laboratory of the U.S. radium corporation, New York, and simultaneously expert of the U.S. bureau of mines, 1921-25. He was professor at Graz 1925-31 and 1937-38, at Innsbruck 1931-37, but after Hitler's occupation of Austria he left the country and, from 1940, was research associate of the Carnegie institute, Washington. His brilliant investigations into cosmic radiation brought him the Nobel prize for physics in 1936.

Hess, (WALTHER RICHARD) RUDOLF (b. 1894). German Nazi leader. Born at Alexandria, Egypt,

April 26, 1894,

he studied there, at Neuchâtel, Switzerland, and at Godesberg, Germany. In the First Great War he was commissioned as an airman, and saw service in France, where he met Hitler.

After the war he studied

Rudolf Hess,
German politician

at Munich, coming under the influence of Haushofer (q.v.). He joined the Nazi party in 1920, and was imprisoned with Hitler in 1923, becoming his secretary the same year and assisting him in the writing of *Mein Kampf*. Blindly devoted to Hitler, Hess was made head of the party organization in Dec., 1932, group leader of the S.S., and, April, 1933, Reich minister without portfolio and deputy Führer. As from July 27, 1934, all bills and decrees had to be submitted to

and passed by him before becoming law and, when Hitler launched the Second Great War, Hess, Goering, and Keitel were appointed a triumvirate to act in his place in emergencies, and Hess was made second in succession, after Goering, in case of Hitler's death. Hess flew alone May 10, 1941, from Augsburg to Scotland, landing near Glasgow, with the idea of persuading Great Britain to a compromise peace. This was one of the most surprising incidents of the war. His mission was a failure, and he was interned at Maudiff hospital, Abergavenny. Indicted in the Nuremberg trials, 1945-46, as a major war criminal, he was sentenced, on account of his mental instability, to imprisonment for life. Oct., 1946. *Consult* The Case of Rudolf Hess, J. R. Rees, 1947.

Hess, WALTER RUDOLF. For biography of this Swiss physiologist, joint-winner of the Nobel prize for medicine in 1949, see N.V.

Hesse. Former grand duchy and (1918-45) state, now a *Land*, of W. Germany. The state had an area of 2,970 sq. m., and pop. 1,469,909. Upper Hesse was separated from the other two provs. by part of Prussia; Wimpfen and other small areas were also isolated. Both the Rhine and the Lahn flow through Hesse. There are a number of hills, but much of the land is flat. Darmstadt was the capital, and before 1866, when there were several states of Hesse, the grand duchy was known as Hesse-Darmstadt. Mainz was the largest town; others were Offenbach, Worms, and Giessen. Agriculture was the main occupation, rye, barley, potatoes, and vines being grown. Coal and iron were mined.

The name of Hesse is that of a tribe, the Chatti, later Hessi. Hesse, a big country already in the 8th century, was in the kingdom of the Franks, in the empire of Charlemagne, and afterwards in the Reich. The counts ruled in the region watered by the Fulda, Werra, Lahn, and Eder, which included the important places, Fulda, Hersfeld, and Marburg. One of its own counts, Conrad I, became German king, 919; from 1122 until 1247 Hesse was united with Thuringia, whence in 1265, Henry, a son of the duke of Brabant, inherited the title of landgrave of Hesse. He was later made a sovereign prince of the empire.

The rulers of Hesse lived and fought very much as did the other

German princelings of the Middle Ages. They divided their lands to form principalities for their sons, but such divisions were not always permanent. The first Landtag appeared about 1387, and gradually the landgraves won their way to the front rank of German princes. The most notable of them was Philip, who figured prominently in the events of the Reformation.

When Philip died in 1567, to provide for his four sons Hesse was divided into Hesse-Kassel, Hesse-Darmstadt, Hesse-Marburg, and Hesse-Rheinfels. Hesse-Homburg was founded in 1622, Hesse-Philippsthal in 1685, and Hesse-Barchfeld in 1721. Hesse-Marburg, Hesse-Rheinfels, and Hesse-Homburg, their ruling families having died out, were united with Hesse-Darmstadt or Hesse-Kassel. Hesse-Kassel was seized by Prussia after the war of 1866; the two other principalities lost their status in the Napoleonic upheaval.

Hesse-Darmstadt thus became the only Hesse. Its connexion with Prussia became closer, and in the war of 1870-71 its troops fought under Prussian generals. The grand-duchy joined the new German empire in 1871, and as such took part in the war of 1914-18. In 1918 the grand duke, Ernest Louis, abdicated, and a republic was proclaimed. This, in turn, was made a Gau by the Nazis. After the Allied conquest of Germany, 1945, most of the country came into the U.S. zone of occupation, and the former territories of the Hessian dynasties were reunited as Greater Hesse (later Hesse) of about 9,000 sq. m. in area, and about 4 million inhabitants, its capital Wiesbaden, and largest town Frankfurt-on-Main. The former Hessian territory W. of the Rhine came under French occupation.

Hesse, HERMANN (b. 1877.) A German-born Swiss poet and author. Born July 2, 1877, at Calw in Württemberg, Hesse became a book-seller. His first lyrical poems were published in 1898, but he gained fame by his educational novel *Peter Camenzind*, published 1904, and many times reprinted. Other novels, usually dealing with the child and adolescent mind, and of a somewhat melancholic and resigned trend, included *Knulp*, *Der Steppenwolf*, and his great romantic novel *Narziss und Goldmund*, 1930. Criticism, philosophical writing, and remarkable travel-diaries made Hesse one of the foremost in German authorship of his day. An anti-Nazi, he emigrated to

Switzerland before Hitler achieved power making his home near Lugano. He was awarded the Nobel prize for literature in 1946.

Hesse - Darmstadt. Name borne until 1866 by the German state later known as Hesse (v.s.). It dated from 1567, when on the death of the landgrave, Philip of Hesse, his lands were divided; his son, George, made Darmstadt the capital of the share he received, his little state being known therefore as Hesse-Darmstadt. He and his successors added to its area, especially when other branches of the family died out. In the 17th and 18th centuries the landgraviate shared in the history of Germany, a record chiefly of civil strife or of wars against France.

Louis, who became landgrave in 1790, fought against France until 1799, but was afterwards on the side of Napoleon. For this Mainz, Worms, and the duchy of Westphalia, lost again in 1813, were given to him in 1803, and the title of grand-duke in 1806. He deserted Napoleon in 1813, and at the congress of Vienna Hesse became the size it retained until 1866. This state joined the Germanic Confederation (1815-66), the Prussian Zollverein, and received a constitution in 1820. There were troubles between ruler and ruled, especially in 1848. In 1866 the grand-duke took the side of Austria. Consequently, after Prussia's victory, a large indemnity was demanded and paid, while Hesse-Homburg, just added to the grand duchy, was taken away.

In 1946 the Hesse-Darmstadt crown jewels, valued at £375,000, were stolen from Kronberg Castle, and three U.S. army officers, including a woman, were charged with the theft. The woman, Mrs. K. N. Durant, was tried and convicted by a U.S. military court at Frankfurt and sentenced to five years' hard labour and dishonourable discharge from the army.

Hesse-Homburg. Formerly a state of Germany. It consisted of a district round Homburg that was separated from the state of Hesse-Darmstadt in 1622. It had its own rulers or landgraves, but these did not become independent of the landgrave of Hesse-Darmstadt until 1768. Hesse-Homburg was included in Hesse-Darmstadt, 1806-15, when its independence was restored and Meisenheim, a small district on the other side of the Rhine, was added to it. In March, 1866, the landgrave Ferdinand died without sons and his territory was divided. The ruler of

Hesse-Darmstadt secured Hesse-Homburg proper, while Meisenheim became Prussian. A few months later Prussia took Hesse-Homburg also, after the war of 1866. The landgraviate had an area of 107 sq. m.

Hesse-Kassel. State of Germany that existed from 1567 to 1866. In 1567 the landgrave of Hesse, Philip, died, and his land was divided between his four sons. The largest share, which was taken by the eldest, William, had Kassel for its capital, and was, therefore, known as Hesse-Kassel. In 1648, at the end of the Thirty Years' War, the territory was enlarged, and there were various later alterations of its boundary.

In the 18th century the rulers obtained money by hiring their soldiers to fight the battles of others, and Hessians fought for Britain in the war of American Independence and elsewhere. In 1785 William IX became landgrave, allied himself with Prussia, and in 1803 was made an elector. In 1807 Hesse-Kassel was included by Napoleon in the kingdom of Westphalia, but it was restored to William in 1813; the title of king was, however, refused to him. Then, as elsewhere, followed grave internal troubles due to the desire of the people for a share in the government and to the refusal of the ruler to grant it. A constitution was given in 1831, but everything possible was done to nullify it, and there was again serious trouble in 1848. After trying to rule by force the elector Frederick William fled, 1850; the country was then entered by Austrian and Bavarian troops. Prussian troops also invaded Hesse, but the upshot was not war between the two parties, but the convention of Olmutz; Hesse was entrusted to the diet of the German Confederation which gave to it a new constitution. The elector, who had returned, refused to adapt his policy to the new conditions, and there was friction for a further decade. In 1866 he took sides with Austria against Prussia, and as a result Hesse-Kassel was occupied by troops of the latter power. By the treaty of peace it was annexed to Prussia.

The electorate was not a single district, but several detached areas, this being due to the way they were acquired. It had in 1866 an area of 3,800 sq. m. and a pop. of about 750,000.

Hesse-Nassau. Former province of Prussia. It lay between the Rhine and Thuringia, its other boundaries including Bavaria and

Westphalia, and was of very irregular shape, while detached portions of territory belonged to it. Its area was 6,060 sq. m., and its pop. 2,578,000. It was divided into the governments of Kassel and Wiesbaden. In addition to these towns it included Frankfort, Fulda, Homburg, and Marburg. The Lahn and the Fulda flowed through it, while the Rhine and the Main were on its borders. It is a hilly district, with many forests and some mining, in addition to agriculture. The province consisted of territories gained by Prussia after the war of 1866. These were Hesse-Kassel, much of Frankfort, Hesse-Homburg, the duchy of Nassau, and other spoils.

Hesse-Rotenburg. A German state that existed from 1627 to 1834. Ernest, a younger son of the landgrave of Hesse-Kassel, received it as a younger son's portion. This he increased, and on his death it was divided into two, one being Hesse-Rotenburg, a small district around Rotenburg, his capital. In 1801 part of the state was taken by France, the landgrave being compensated by other territory. In 1834 the ruling family became extinct, and Hesse-Rotenburg was united with Hesse-Kassel.

Hessian Boot. High boot worn over tight pantaloons and bearing a tassel in front. Named probably from Hesse, in Germany, it was introduced early in the 19th century as a modification of the 18th century top-boot, and worn with outdoor dress it formed for a time part of the dress of English general officers until superseded by the Wellington boot. See Boots and Shoes, colour plate.

Hessian Fly (*Cecidomyia destructor*). Dipterous insect of the gall midge family (q.v.). It is a

Hessian Fly. A destructive midge, greatly enlarged

widely spread insect, about $\frac{1}{16}$ in. long, which lays its eggs on cereals and grasses. The larvae live in the stems near ground-level, which weakens the straw so that the crop readily "lodges." The name Hessian Fly was given to it in the U.S.A. where it seems to have been introduced by Hessian troops,

having been carried over as pupae in straw. This pest is serious in America, but rarely so in Britain, where its attacks are spasmodic.

Hestia (Gr., hearth). In Greek mythology, the goddess of the hearth. She was not only a domestic goddess, but in every town and state there was a hearth sacred to Hestia, the fire of which was never allowed to go out. Her Roman counterpart was Vesta.

Heston and Isleworth. Bor. of Middlesex, England, formed of the two parishes of Heston and Isleworth. It stands on the Thames, 12 m. W.S.W. of London on the Southern rly. There are soap and perfume works, breweries, engineering works, and almshouses. It was allotted one M.P. in 1945.

Heston and Isleworth arms

Formerly part of a forest extending from Brentford to Staines, Isleworth, pron. Izleworth, is called Gistelesworde in Domesday, and in the 14th century was known as Histelworth. Syon House (*q.v.*), a seat of the duke of Northumberland, is on the site of the monastery of SS. Saviour and Bridget, founded in 1415, in which Queen Catherine Howard was imprisoned in 1541. The 14th century parish church of All Saints was rebuilt in 1705, enlarged in 1865, and, with the exception of its tower, completely destroyed by fire in 1943. John Hall, one of the vicars, was hanged in 1535 for denying the royal supremacy of Henry VIII. Gumley House, Gordon House, and Worton Hall are noteworthy. In 1890 the London international college, 1867, associated with Richard Cobden, became a training college for teachers. Notable residents were the duchess of Kendal, Sir Thomas Ingram, Lord Baltimore (founder of Baltimore in the U.S.A.), R. B. Sheridan, and Sir Joseph Banks. Osterley Park (*q.v.*), in the vicinity, was the seat of the earl of Jersey. Heston airport, opened in 1929, was, until the Second Great War, the principal centre for private flying near London. Pop. 95,600.

* **Hesychasts** (Gr. *hēsychos*, quiet). Term applied to a school of Quietists among the Greek monks of Mt. Athos in the 14th century. They practised a kind of self-hypnotism by gazing fixedly at their own navels, searching the seat of the soul, and in this condition were supposed to receive spiritual illumination. They held that God

dwells in eternal light; that this light is the vehicle of His activity; and that the light illuminates the souls of those who practise intense abstraction and self-denial. Their teaching gave rise to controversy in the Eastern Church.

Hesychius (5th century A.D.). Alexandrian grammarian. He was the author of a Greek lexicon, which is of great value for its collection of unusual words, and quotations from authors whose works have been lost. Hesychius was a heathen, and the work in its present form contains obvious traces of revision by a Christian scribe or grammarian. The source of the work is the lexicon of Diogenianus (2nd century), itself based upon an earlier one by Pamphilus (1st century). He is not to be confounded with Hesychius of Miletus, probably of the 6th century, author of a universal history from the earliest times down to the death of Anastasius, 518, part of which, dealing with the history of Constantinople, is still extant; and of an Onomatologos (list), or biographical dictionary of literary persons and others, much used by Suidas in his lexicon.

Hetairai OR **HETAEERAE**. Superior class of courtesans in ancient Greece who flourished especially at Athens and Corinth. Accomplished dancers and musicians, many of them were also highly educated. The most famous of them were Aspasia, mistress of Pericles, a woman of high intellectual gifts and great powers of fascination, and Phryne, who sat as a model to Apelles for his great picture of Aphrodite Anadyomenē.

Heterodyne. Phenomenon of radio transmission. The addition of two sinusoidal sound waves of nearly equal frequency leads to the phenomenon, known as beats, of the alternate swelling and lowering of the aggregate sound intensity. It takes place at a frequency equal to the difference of the fundamental frequencies. The corresponding phenomenon resulting from the addition of two alternating electrical quantities of nearly equal frequencies is referred to as heterodyne. In practice this phenomenon is applied in a certain type of radio receiving circuit. This circuit is adjusted to give local continuous oscillations of a frequency nearly equal to those of the radio-wave transmission; modulation results and gives rise to audio signals in telephones suitably connected in the circuit. When the envelope frequency, which is equal to the difference frequency,

is higher than the audio-frequency range, the phenomenon is termed a supersonic heterodyne (superhet). This method of radio reception has many advantages, and its salient feature is that the frequency of the oscillator in the frequency changer is varied, according to the frequency of signal which it is desired to receive, so that the frequency of the output voltage of the frequency changer remains constant. This constant frequency is referred to as the intermediate frequency, and by amplifying at this frequency, say 100 Kc, instead of at radio frequencies a considerable saving in complexity of apparatus and cost is effected.

The heterodyne principle is applied to the measurement of frequency, and the essentials of the apparatus required are a variable frequency electron oscillator of good stability and a sensitive detector amplifier (or a radio-receiving set). The frequency of the calibrated oscillator is varied until zero beat is obtained with the unknown frequency, as indicated by the detector or receiving circuit.

Heteropoda (Gr. *heteros*, other; *pous*, foot). Section of the Gastropoda adapted for free swimming at sea. The foot is modified and flattened laterally to serve the purpose of a fin, and the animal swims with its lower side uppermost. They are met with at the surface of the warmer seas, usually in dense companies. The shell and tissues are transparent, so that the internal organs can be seen; and all the species are carnivorous. They are divided into three families, having respectively a coiled shell, a rudimentary shell, and no shell. See Gastropoda.

Heteroptera (Gr. *heteros*, other; *pteron*, wing). Division of the Hemiptera, an order of insects, in which the wings are unlike. The fore-wings are hardened at the base and membranous at the apex, being thus partly elytra, while the hind-wings are wholly membranous. They lie flat on the back, not sloping at an angle to form a kind of roof. Like all the hemiptera, they are provided with a rostrum or beak, and obtain their food by suction. Known as plant bugs and water bugs, they include many families. The common bed bug belongs to this sub-order. See Insect.

Hetton. Urban dist. and parish (Hetton-le-Hole) of Durham, England. It is 7 m. by railway S.S.W. of Sunderland. The neighbouring coal mines employ most of the inhabitants. Pop. 20,717.

Heulandite. Member of the zeolite group of minerals. Heulandite is a hydrous silicate of calcium and aluminium, often containing smaller amounts of soda and strontia ($\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2 \cdot 5\text{H}_2\text{O}$). It occurs as white or brown monoclinic crystals or globular masses, principally in cavities in basaltic and related rocks associated with other zeolites (*q.v.*).

Heuss, THEODOR (b. 1884). First president of the fed. republic of W. Germany. See N.V.

Hevelius, JOHANN (1611–87). A German astronomer. Born at Danzig, Jan. 28, 1611, he became interested in astronomy in 1639 and built his own telescope of 150 ft. focal length. His principal work was on sunspots, comets, and the lunar surface; but he is chiefly remembered for his catalogue of 1564 stars and its accompanying atlas, in which he outlined seven new constellations, which are still used. He died Jan. 28, 1687.

Hever Castle. Castellated mansion near Edenbridge, Kent. In Edward III's time a castle was built here by Sir William de Hevre, and in the 15th century a new one was erected by Sir Geoffrey Boleyn, a former lord mayor of London, who had bought the estate. Here his descendant Anne Boleyn lived, and her ghost is said still to haunt the place. Henry VIII afterwards granted it to Anne of Cleves. The castle fell into decay. It was purchased about 1890 and restored by the 1st Viscount Astor.

Hevesy, GEORGE DE (b. 1885). Hungarian chemist and physicist. Born Aug. 1, 1885, he discovered in 1922, in collaboration with the Danish physicist D. Coster, a new element, hafnium, thereby contributing a decisive proof to Bohr's theory of the structure of the atom. This, and his work on the separation of isotopes as chemical and biological indicators, brought him the Nobel prize for chemistry in 1943. Professor at Copenhagen university at the time of Hitler's invasion, he escaped to Stockholm.

Hewart, SIR GORDON HEWART, 1st Viscount (1870–1943). British lawyer. Born at Bury, Jan. 7,

1870, he was educated at Manchester Grammar School and University College, Oxford. After a journalistic career he turned to the law and was called to the

bar in 1902. He became a K.C. in 1912, and in 1913 was returned as Liberal M.P. for Leicester. In 1916 he joined the Coalition government as solicitor-general, and in Jan., 1919, became attorney-general, in which capacity he was a signatory of the Anglo-Irish treaty, 1921. In 1922 he became lord chief justice and Baron Hewart of Bury, and on his retirement in 1940 was created a viscount, dying May 5, 1943. In 1929 he published *The New Despotism*.

Hewlett, MAURICE HENRY (1861–1923). British author. Born in London, Jan. 22, 1861, he was called to the bar in 1891, and held a post in the civil service, 1896–1900. He established his reputation in 1898 with *The Forest Lovers*, a romance of the kind of vague medievalism which William Morris had initiated. His other stories include *Little Novels of Italy* (with the dainty Madonna of the Peach Trees), 1899; *Richard Yea and Nay* (*Coeur de Lion*), 1900; *The Stopping Lady*, 1907; *Brazen-*

M. Hewlett
Beresford

Hever Castle, Kent, once the residence of Anne Boleyn. It was restored by Viscount Astor

head the Great, 1911, and *Mainwaring*, 1921. He also wrote verse, including *Pan* and the *Young Shepherd*, 1898; and essays, *In a Green Shade*, 1920. He died at Broadchalke, near Salisbury. June 16, 1923.

Hexachord (Gr. *hex*, six; *chorde*, chord). Scale of six notes. It was established by Guido d'Arezzo for the purposes of his teaching of solmisation, thus superseding the Greek system of tetrachords. The term is sometimes used to denote a six-stringed lyre; occasionally, to express the interval of a sixth.

Hexagon. Plane figure having six sides and six angles. A regular hexagon has six angles, each 120° , and six sides each equal to the radius of the circumscribing circle.

Hexahedron. Solid, having six plane faces or surfaces. The regular hexahedron is the cube, all six faces being squares of equal size.

Hexameter (Gr. *hex*, six; *metron*, measure). Metrical line or verse containing six feet, of which the penultimate one must be a dactyl and the final one either a spondee or a trochee. It is the metre of the classical epics, but is not well adapted to the genius of the English language. Longfellow's *Evangeline* is the best known successful hexameter poem in English. Instances of accented hexameters occurring in English prose without intention are not uncommon, e.g. *How art thou fallen from heaven, O Lucifer, son of the morning* (Isaiah 14, v. 12).

Hexamine or **UROTOPINE**. A compound formed by ammonia and formaldehyde. Chemically it is hexamethylenetetramine. Hexamine is used as a urinary disinfectant, its activity being due to the liberation of formaldehyde in acid urine. Sodium acid phosphate must be given synchronously to ensure an acid urine, as the substance is inactive in the urinary tract in an alkaline medium. Hexamine is also used as a biliary disinfectant, when it acts without the aid of sodium and phosphate, being activated by the presence of bile salts.

Hexapla, THE.

Work compiled by Origen (*q.v.*). The term means "six-fold" (neut. pl. of Gr. *hexaplois*), and was suggested by

the plan adopted by Origen to show the divergences between the Septuagint, the later Greek versions, and the current Hebrew text of the O.T.

The compilation of Origen is arranged in six parallel columns. The first contains the Hebrew words; the second a transliteration of the Hebrew words in Greek characters; the third the Greek equivalents in the version of Aquila (*f.* 128–129), a version intended to be much more literal than that of the Septuagint; the fourth the Greek equivalents in the version of Symmachus (*f.* c. A.D. 180–192), a

Lord Hewart,
British lawyer

much freer version than that of Aquila; the fifth the Greek equivalents in the Septuagint (*g.v.*); the sixth the Greek equivalents in the version of Theodotion (*fl.* perhaps under Marcus Aurelius), a free revision of the Septuagint.

Hexateuch, *THE* (Gr. *hex*, six; *teuchos*, volume). The term pentateuch is an ancient designation of the first five books of the Bible (Gr. *pente*, five), which were ascribed to Moses by Jewish and Christian tradition, followed by that of Islam. These books are known collectively to the Jews as the *Torah* (law) and are described by them sectionally as "the five-fifths of the law." The term hexateuch was invented by modern scholars in order to include in the same group a sixth book, the book of Joshua, which is linked closely by its contents and style to the preceding five books, and is based on the same documentary sources.

It is contended that the pentateuch, except in certain sections, does not claim to be the work of Moses. It is a book about Moses, just as the book of Joshua is a book about Joshua. Together with the book of Joshua, it is, in fact, according to most modern scholars, a composite work framed and edited out of materials of varying date (c. 850–400 B.C., though some fragments, e.g. the decalogue, may well be much older).

Doubts as to the Mosaic authorship of the pentateuch had already been expressed by such writers as Hobbes (1651), Peyrerius (1654), Spinoza (1671), Le Clerc (1685), and by the French Oratorian, R. Simon (1678), who has been called "the father of O.T. criticism." But criticism proper began with Jean Astruc, a French physician, who in 1753 distinguished two different accounts of the creation in Genesis, (*a*) Gen. 1, v. 1–2, v. 4a, and (*b*) Gen. 2, v. 4b–3 end; and that in (*a*) God is referred to as *Elohim*, while in (*b*) the personal name *Jehovah* (properly *Yahweh*) is used. Astruc did not deny the Mosaic authorship of the pentateuch, but considered that he could identify various sources used by Moses. His theory, which eventually posited the existence of ten sources, was developed by Eichhorn (1779) and Ilgen (1798) and is known as the earlier documentary hypothesis.

The fragmentary hypothesis of A. Geddes (1800), expanded by Vater (1805), was attacked by de Wette, who insisted on the unity of the pentateuch in its present form, and the next important

development was the supplementary hypothesis of F. Bleek (1822), to which, in a modified form, some scholars still incline. According to this theory, an historical work containing the main part of Genesis, Numbers and Joshua, and including Deut. 34, vv. 1–8, all being the work of the Elohist (the author of the source using *Elohim* in Astruc's theory), was edited and supplemented by a Jehovist writer (the author of the *Jehovah* source). The whole was revised again by the author of Deuteronomy in accordance with the ideas expressed in that book.

The explanation most widely accepted at the present day of how the hexateuch came to take its existing form is the later documentary hypothesis. The development of this began with Hupfeld (1853), who, following a hint of Ilgen, showed that in Genesis there were three strands combined by redactors; of these, two used the word *Elohim*, and one of the Elohist's evidently had a priestly bias. Hupfeld's theory was expanded by Graf (1866), Kuenen (1861; influenced by Bishop Colenso), and Wellhausen (1878), and in its present form assumes the use of four independent documents, combined as follows. A Jehovist work (c. 800 B.C.), derived from Judah and referred to as *J*, and an Elohist work (c. 750 B.C.), derived from Ephraim (*E*), circulated independently for a time. Later (some time before 650 B.C.) these two works were combined. The united work, which has been described as the "oldest book in Hebrew history" incorporated (from *E*) the earliest of the three chief codes of Hebrew law, now known as the book of the covenant. It has no mention of the reform abolishing the "high places" and limiting sacrifice to the temple at Jerusalem. In 620 B.C., during the reign of Josiah, a work almost, but not entirely, identical with Deuteronomy as it is today was discovered, an event which led to the reforms of Josiah recorded in 2 Kings 22 and 23. Soon afterwards, this work, with additions at the beginning and the end, was combined with the other two by redactors. The Deuteronomist strand is known as *D*, and the formula results:

$$\frac{(J+E)+D}{Rje \quad Rd} = JED$$

There next arose a document containing an ancient body of laws (Lev. 17–26), which stands midway between Deuteronomy and

the priestly legislation noticed by Hupfeld. This is known as the holiness code (*H*), and was incorporated during the exile in a later priestly work known as *P*. *P* was promulgated by Ezra in (probably) 444 B.C., and some time afterwards was combined by redactors with *JED* to produce the hexateuch in its present form:

$$\text{Hexateuch} = \frac{(J+E)+D+P}{Rje \quad Rd \quad Rp}$$

Although this hypothesis is firmly established and offers a satisfactory explanation of the linguistic and stylistic differences of the various parts of the hexateuch, the question is by no means regarded as closed, especially where the fate of Deuteronomy is concerned, and some scholars are prepared to abandon the hypothesis altogether. There is a tendency to re-examine the criteria of criticism in the light, for example, of archaeology, to recognize the dangers of attempting to allot isolated fragments to one source or another, and to admit that the authors of *J* and *E* may have used much older material. Yet no alternative hypothesis has gained a wide acceptance, and this one has the merit of not merely being based on language and style, but of agreeing with the general historical trend, which postulates a gradual but inevitable development from prophet to priest, and then to ritual and law. See Bible; Pentateuch.

Bibliography. Introduction to the Old Testament, C. H. Cornill, 1907; Dictionary of the Bible, ed. J. Hastings, 1898; The Book of Genesis (Westminster Commentaries), S. R. Driver, 11th ed., 1920; The People and the Book, ed. A. S. Peake, 1925; An Introduction to the Books of the Old Testament, W. O. E. Oesterley and T. H. Robinson, 1934; The Old Testament: a Reinterpretation, S. A. Cook, 1936; Record and Revelation, ed. H. Wheeler Robinson, 1938.

Hexham. Market town and urban dist. of Northumberland, England. It stands on the S. bank of the Tyne, 20 m. W. of Newcastle, and is on the rly. (N.E. region). The town has ironworks and other industries and a trade in agricultural produce, while in the neighbourhood are coal mines. The chief building is the priory church, a magnificent E. E. building, restored in the 19th century. It was not entirely completed by its builders, the Augustinian canons, the nave being finished only in the 20th century.

Hexham. The Moot Hall, the 15th century tower of the bailiffs of the archbishops of York

There are some remains of the priory of the Augustinian canons, which was dissolved at the Reformation. Other buildings are the grammar school and two old buildings, the 15th century Moot Hall and the Manor Office, built in 1330. The urban council owns the water supply and markets. Race meetings are held.

Hexham grew up around the church founded in the 7th century, and at one time had its own bishop. After the Norman Conquest the town and district, called Hexhamshire, was a liberty ruled by the bishop and later by the archbishop of York. It was not united with the co. of Northumberland until 1572. It returns one M.P., being represented 1918-23 and from 1924 by D. Clifton Brown, elected Speaker in 1943. Market day, Tues. Pop. 8,888.

The battle of Hexham was fought May 15, 1464, between the Lancastrians and the Yorkists. It took place on the Linnels, 3 m. from the town. Beaten at Hedgeley Moor (*q.v.*), the Lancastrians collected a force and, led by Henry Beaufort, duke of Somerset, came up with the Yorkists under Lord Montagu. The latter were superior in numbers, whereupon the Lancastrians melted away, except about 500, who were soon killed or captured. Somerset was executed.

Hexuronic Acid. Vitamin C. It was first obtained in a pure state from extracts of suprarenal glands and orange juice in 1928 by Szent-Györgyi, though the identity of the substance with Vitamin C was not at first realized. See Ascorbic Acid; Vitamins.

Hexyl OR **HEXANTRODIPHENYLAMINE.** Explosive, much used by the Germans, usually in admixture with other explosives as a filling for bombs, mines, and torpedo warheads. It is prepared by the direct initiation of diphenylamine. It is a high melting, yellow powder which turns brown in sunlight, and is poisonous and harmful to the skin. See Explosives.

Heyden, JAN VAN DER (1637-1712). Dutch painter and etcher. He was a native of Gorkum. Most of his pictures are of buildings or ruins in Dutch towns, but he travelled widely on the Continent and in England, painting wherever he went. Lingelbach, Adriaan van de Velde, and Eglon van der Neer frequently painted the figures in van der Heyden's works. He died at Amsterdam, Sept. 28, 1712.

Heydrich, REINHARD (1904-42). German Nazi police officer. He was born at Halle, Germany, on March 7, 1904. As a youth he joined a terrorist organization which aimed at the overthrow of the Weimar republic. Entering the navy 1922, he rose to the rank of lieutenant, but was compelled to resign, 1931, on account of his private immorality. He joined the Nazi party 1932, becoming Himmler's adjutant.

Reinhard Heydrich, Nazi police officer

Made chief of the Munich police, 1933, he participated in the "liquidation" of the Roehm group, and was appointed, 1935, chief of the security police, including the Gestapo, running with Himmler the concentration camps and German world espionage.

After Heydrich had attempted by terror and mass murder to break the resistance movements in Norway and the Netherlands, he was made deputy-protector of Bohemia and Moravia, Sept., 1941. He immediately had some 250 Czechs killed and hundreds of others arrested. A bomb was thrown and shots were fired at him in a suburb of Prague, May 26, 1942, as a result of which he died June 3. The village of Lidice (*q.v.*) was obliterated, and its inhabitants, who were accused of harbouring his assassins, were murdered or carried off to Germany.

Heye Foundation. Museum of the American Indian in New York. It was established in 1920 by Dr. George G. Heye to

gather and preserve for students everything useful in elucidating and illustrating the ethnology of the aborigines of the western hemisphere. The museum, in 155th St., was completed in 1922, the site and £70,000 towards its construction having been given by A. M. Huntington, a New York businessman. It has more than 2,000,000 exhibits, together with laboratories and study rooms for the use of students, and issues monographs and other publications relative to its researches. The library contains some 25,000 volumes and complete issues of all relevant periodical publications.

Heymans, CAMILLE (b. 1892). Belgian professor of pharmacology. Born March 28, 1892, at Ghent, he studied there, at Paris, Lausanne, Vienna, and at Cleveland, Ohio. He became an M.D. and a lecturer at Ghent in 1923, fellow of the Belgian-American educational foundation 1927, and professor of pharmacology 1930. After lecturing in U.S. universities in 1937, chiefly on his research into pharmacodynamics, he was awarded the Nobel Prize for medicine in 1938 for his discoveries concerning the influence of sinus and aorta mechanism in breathing. He was a member of many learned societies, and winner of Belgian, French, and other prizes. During the Second Great War he was head of the medical department of the Allied relief committee.

Heyse, PAUL JOHANN LUDWIG (1830-1914). A German novelist, poet, and dramatist. He was born

Paul Heyse, German writer

at Berlin, March 15, 1830, and educated at Bonn university. After some travelling about Italy, which he frequently re-visited, he was summoned by Maximilian of Bavaria, whose attention he had attracted by his epic poems, to Munich, where he spent the rest of his life. His best work is seen in his short stories and longer novels on social and religious questions, the best of these being *L'Arrabbiata* (Eng. trans. 1867), *Children of the World* (Eng. trans. 1882), *In Paradise*, and *Merlin*.

His dramas, though they reach a high standard of literary excellence, were unsuited for the stage; Hans Lange, Kolberg, and Mary of

Magdala, however, enjoyed a certain amount of success. His work shows the influence of his intimate acquaintance with Italy and its people. Heyse was awarded the Nobel prize for literature, 1910. He died at Munich April 2, 1914. *Consult* his autobiography, *Youthful Reminiscences and Confessions*, 1901-12.

Heysham. Formerly an urban dist. of Lancashire, England, now part of the bor. of Morecambe and Heysham. The railway station is alongside the British Rlys. harbour, with steamship service to N. Ireland and the Isle of Man. *See* Morecambe and Heysham.

Heythrop. Village of Oxfordshire, England. It is 3 m. N.E. of Chipping Norton, and gives its name to a pack of foxhounds that hunt this part of the county. Heythrop House was long the residence of Albert Brassey (1844-1918), master of the pack for over forty years from 1873. In the vicinity are the Rollright Stones, forming an ancient stone circle.

Heywood. Mun. bor. of Lancashire, England. It is 9 m. by railway N. by E. of Manchester. It has extensive cotton and woollen factories, other industries including the manufacture of machinery and chemicals. The municipality owns the markets and baths. There are three recreation grounds, a free library, art gallery, and museum, the last being the gift of Thomas Kay of Stockport. Queen's Park was presented by Queen Victoria. With Royton it gives its name to a county constituency returning one member to Parliament. Market day, Fri. Pop. 25,120.

Heywood, JOHN (c. 1497-1580). English epigrammatist and writer of interludes. A Roman Catholic friend of More, he is believed to have been at Oxford, and was a favourite of Henry VIII and Queen Mary. His Proverbs on marriage proved a rich quarry for the Elizabethan dramatists. The Four Ps is his best interlude. *Consult* complete works, ed. J. S. Farmer, 1905-06; *Life and Works of John Heywood*, R. Bolwell, 1922.

Heywood, THOMAS (d. c. 1650). English actor and dramatist. He is supposed to have been born in Lincolnshire about 1575 and educated at Peterhouse, Cambridge. In 1598 he became an actor in Henslowe's company and, after the accession of James I, a member of the queen's company of players. About 1596 he wrote his first play, *The Four Prentices*

of London (printed 1615), and in 1633, in a prefatory address to *The Traveller*, he claimed to have had "either an entire hand, or at the least a main finger" in 220 plays. Of these pieces only 35 are known to exist.

He attempted every kind of drama, and also wrote pageants, four of which are still extant, poems, translations, and various prose works, including *An Apology for the Lord Mayor*, 1631-39; *Several Actors*, 1612; *Nine Books of Women*, 1624; and a *Life of Queen Elizabeth*, 1631. Of his plays, *Edward IV*, 1600, and *A Woman Killed With Kindness*, 1603, are perhaps the best examples; the first a "chronicle history," the second a drama of domestic sentiment. A collection of his extant plays was published, 6 vols. 1874, and a selection from them, ed. J. A. Symonds, in the *Mermaid Series*, 1903. *Consult* *Select Plays*, ed. J. A. Symonds and A. W. Verity, 1888; *Thomas Heywood*, A. M. Clarke, 1931.

Hezekiah. King of Judah (2 Kings 16, 18-20; 2 Chron. 29-30). He succeeded his father, Ahaz, at the age of 25, and was a notable reformer, who abolished the centre of idolatrous worship and destroyed the brazen serpent of Moses, which at this time seems to have been regarded as a kind of idol. He also cleansed the Temple and restored the worship of Jehovah. For a time he continued the tributary alliance with Assyria, but later repudiated it and had to face two invasions under Sennacherib. The first of these was partly successful, but in the second Hezekiah completely routed his foes. He was a man of considerable literary and poetic gifts, and is regarded by the Jews as one of their most famous monarchs.

Hiawatha. One of the many names of a traditional personage of miraculous birth. Various tribes of the N. American Indians believed he had been sent to teach them the arts of peace.

Hiawatha. THE SONG OF. Epic poem by H. W. Longfellow, 1855, embodying the legends and traditions of the N. American Indians. Taking as model for his verse form the unrhymed Finnish epic of *The Kalevala*, the poet gave the story of Hiawatha from his wondrous birth to his final passing "To the land of the Hereafter," and embodied in it much of Indian lore. Written in unrhymed trochaic tetrameters, the novelty of its form provoked

much criticism, and was a ready target for parody (cf. Lewis Carroll's *Hiawatha's Photography*) but the poem is now not unjustly regarded as Longfellow's greatest achievement.

Samuel Coleridge-Taylor, while still a student at the Royal College of Music, wrote *Hiawatha's Wedding Feast*, the first part of a trilogy, 1898; the second part, *The Death of Minnehaha*, was performed at the Staffordshire festival, 1899, and *Hiawatha's Departure* was produced a year later by the Royal Choral Society at the Royal Albert Hall. This work brought lasting fame to the composer throughout the English-speaking world.

Hibbert Trust. THE. Trust founded under the will of Robert Hibbert (1770-1849). The income arising from the funds is applied in such manner as the trustees deem conducive to the spread of Christianity in its simplest form, and to the exercise of private judgement in religion. The Hibbert lectures are delivered under the auspices of the Trust. The Hibbert Journal was founded in 1902 with its support. Scholarships for post-graduate study are awarded to suitable students for the ministry. The office of the Trust is at 14, Gordon Square, London, W.C.

Hibbing. Village of Minnesota, U.S.A. The largest municipality on the Mesabi, Vermilion, and Cuyuna iron ranges, it stands on the Duluth R., 82 m. N.W. of Duluth, in St. Louis co., and is served by rlys. Settled in 1892 and incorporated as a town the next year, it was a lumber centre until iron ore was discovered in the streets. A company bought the land on which the village stood, and in 1919 the community was literally removed one mile S. On the deserted site developed the world's largest open-pit mine, which yielded 17,000,000 gross tons of iron ore in 1940, all Hibbing producing 46,000,000 tons. Hibbing has retained the village form of government to preserve its very lucrative tax revenue. Pop. 16,385.

Hibernation (Lat. *hibernare*, to pass the winter). Dormant or torpid condition in which many animals and plants pass the winter. For animals it may be continuous or intermittent. It is caused not so much by cold as by the lack of food which cold produces. The absence of foliage obliges large numbers of insects and molluscs to pass the winter in a torpid state. This necessitates for the

insectivorous birds migration in autumn to warmer countries where food is plentiful.

This expedient is not available for the mammals and reptiles, so after laying up a store of fat in their tissues, they retire into winter quarters and fall asleep. The British bats, which are entirely insectivorous, retire to caves, hollow trees, and the roofs of dwellings; but some are sensitive to a rising of outdoor temperature, and come out for an occasional winter flight and feast upon the insects that have also been awakened. Some species, like the squirrel and dormouse, provide for such intervals by laying up secret caches of nuts and grain to which they can resort, afterwards resuming their sleep. During this period the body temperature falls, the pulse is reduced, respiration is feeble, and other functions are largely suspended. Frogs bury themselves in the mud at the bottom of ponds; toads, newts, and snakes retire to holes in the ground.

Among insects hibernation is almost general where the food is vegetation, and it may be passed in any stage of the life cycle—as egg, larva, pupa, or perfect insect. Familiar butterflies like the brimstone and the small tortoiseshell frequently occasion newspaper paragraphs by appearing on the wing during some genial sunny interval in midwinter, but these are only hibernating females awakened by a rise in temperature.

Hibernation is quite common among plants, the dormancy (*q.v.*) of many bulbs and underground rhizomes representing the hibernating condition. The behaviour of frogbit (*q.v.*) and other floating plants which withdraw all their substance into winter-buds which sink to the bottom mud is also hibernation; but there are similar phases of inactivity in plants which must be differentiated.

Hibernia or **IVERNIA**. Name given to Ireland by Latin writers. Aristotle spoke of it as *Ierne*, and Latin authors evolved the form *Hibernia*. See *Ireland*.

Hibernians, ANCIENT ORDER OF. Society composed of Catholic Irishmen, organized on benefit lines. It is said to have been founded by Rory O'More in the 17th century under the name of the Defenders. After Catholic Emancipation in 1829, the society was remodelled and its operations were extended to Great Britain, as well as to N. America, Australia, and elsewhere. Members must be of Irish birth and profess the R.C. religion.

Hiccup. Convulsive act produced by spasmodic contraction and descent of the diaphragm, the large horizontal muscle which separates the cavity of the chest from the abdomen. It is frequently due to over-distension of the stomach, and is sometimes a symptom in more serious diseases such as peritonitis, cancer of the stomach, and typhoid fever. It may arise from hysteria or epilepsy. Hiccup may generally be stopped by holding the breath for a minute, though severe cases demand removal of the cause.

Hichens, ROBERT SMYTHE (b. 1864). British novelist. Born at Speldhurst, Kent, Nov. 14, 1864,

Robert Hichens

Russell

he was educated at Clifton, and abandoned a musical career for that of literature. He attracted attention with a satirical first novel, *The Green Carnation*, 1894, and achieved a best-seller with *The Garden of Allah*, 1905, a study of the clash between religion and passion in the Orient. His other novels included *Bella Donna*, 1909; *The God Within Him*, 1926; *The Paradine Case*, 1933; *Harps in the Wind*, 1945; *Incognito*, 1947. His memoirs, *Yesterday*, also appeared in 1947. He wrote plays, e.g. *The Real Woman*, 1909, and dramatised his own *Bella Donna* and (with Mary Anderson) *The Garden of Allah*.

Hickory (*Carya*). A genus of trees of the family Juglandaceae, natives of N. America. The leaves are large, divided into oblong leaflets arranged feather-fashion, like those of the nearly related walnut trees. The flowers, which are without petals, are male or female; the males in hanging catkins, the females in a short spike at the end of the new shoots. The husk of the large fruit splits into four segments, revealing the

thin-shelled nut. The timber is hard and tough. *C. illinoensis* is the pecan, whose delicious olive-shaped nuts are a favourite fruit. *C. ovata*, shell-bark or shag-bark, produces the principal hickory-nut of the markets. *C. luciniosa* is the big shell-bark or king-nut; *C. alba*

the mocker-nut; *C. aquatica* the bitter pecan, and *C. glabra* the pignut or broom hickory.

The shell-bark was introduced into Great Britain in 1629. Hickory trees thrive best if grown as specimen trees in any ordinary soil on lawns or the borders of woodlands, and may be planted in either autumn or spring. When pruning takes place in Nov. the thinnings of the hickory are particularly valuable, if preserved and dried, for use as walking-sticks.

Hicks, SIR (EDWARD) SEYMOUR (1871–1949). British actor and playwright. Born at St. Helier, Jersey, Jan. 30, 1871, he first appeared on the stage at Islington in 1887. Engaged by the Kendals, he toured with them in England and the U.S.A. He was principal light comedian in musical comedies at the Gaiety, 1893–98. He built the Aldwych Theatre (*q.v.*), which he opened in 1905 with his play for children, *Bluebell in Fairyland*, and in 1906 opened the Hicks (later Globe) Theatre with his musical piece, *The Beauty of Bath*.

Hicks wrote and produced some 66 plays, mostly comedies, ap-

pearing in several; they included *The Gay Gordons*, *The Catch of the Season*, *This World of Ours*, *Vintage Wine* (with A. Dukes); and among adaptations, *Sleeping Partners*, *The Man in Dress Clothes*, *The Miracle Man*. He assumed management of the Prince's Theatre, 1916; Daly's, 1934; Victoria Palace, 1935. In a film, 1935, he was a fine Scrooge. He took the first concert party to France in 1914, and during the Second Great War was chairman of *Ensa* (*q.v.*). He married Ellaline Terriss in 1902, was knighted 1935, and died April 6, 1949. Among his books of reminiscences was *Me and My Missus*, 1939.

Sir Seymour Hicks, British actor and playwright

Hicks, WILLIAM (1830–83). British soldier, commonly known as Hicks Pasha. He joined the Indian Army in 1849, served throughout the Indian Mutiny, and acted as brigade major in the Abyssinian campaign of 1867–68. Retiring as hon. col. from the British

Hickory. Leaves and nuts of the N. American tree

army in 1880, Hicks was appointed in 1883 to the command of the Egyptian expedition against the Mahdi. The forces of the latter were signally defeated near Jebel 'Ayn on April 29, and Hicks pushed forward up the White Nile to Duem, whence he branched off across the desert to El 'Obeid. Betrayed by their guide, the Egyptian force fell into an ambush at Kashgilad, after defending themselves bravely for three days till their ammunition gave out, were virtually annihilated. Hicks fell, Nov. 5, 1883.

William Hicks,
British soldier

Hicksites. Unofficial name for a section of the Society of Friends in the U.S.A. which broke away from the parent body in 1827-28. Elias Hicks was a Long Island farmer who had travelled through the U.S.A. and Canada on preaching tours. He stressed the importance of individual belief guided by the "inner light," thus limiting the authority in doctrine given to the elders by more conservative Quakers. At the time of disruption the Orthodox Friends and the Hicksites were about equal in numbers, but later the former outnumbered the dissentients.

Hidalgo (Span. *hijo de algo*, son of something). Spanish title. It was formerly used of a member of the lower nobility, but now seldom denotes more than gentle birth. The Portuguese form is *fidalgo*.

Hidalgo. Minor planet remarkable for the size of its orbit (mean distance from the sun 5.8 times that of the earth), long period (14 years), large orbital inclination (43° to the ecliptic), and eccentricity (0.65). At its maximum distance from the sun it is as far out as Saturn, but at perihelion it comes close to the orbit of Mars. Perturbations caused by Jupiter may account for the extraordinary orbit. See Asteroids.

Hidalgo. Central inland state of Mexico. It covers an area of 8,057 sq. m. and forms part of the great central plateau. It rises in places to 10,500 ft., but the S. and S.W. portions contain many fertile valleys. The chief agricultural products are cereals, coffee, sugarcane, tobacco, and cotton, and the agave is also cultivated for the production of pulque, the national drink. Mining is an important industry, most of the Mexican silver coming from this state, and

iron ore being worked. Communication is provided by the Mexico National rlys. and good motor roads. Pachuca is the capital. Pop. 771,818.

Hiddenite. Variety of the mineral spodumene, occurring in clear crystals of a rich emerald green colour. It is found in North Carolina associated with emerald. Hiddenite is much rarer and more valuable than the latter. See Spodumene.

Hide. Anglo-Saxon measure of land. There has been much discussion about its size, the estimates ranging from 30 to 120 acres. It began as the amount of land necessary to support a single household, which was probably the labour of eight oxen for 120 days in the year. After a time it was regarded as consisting of 120 acres, not necessarily acres of 4,840 yards, but smaller ones. In each hide were four virgates.

At the time of the Norman Conquest the hide was primarily a unit of assessment, not a measure, and this is why it figures so regularly in

Hide. Term used for the skin of an animal. Any skin is a hide, but, commercially, hide is used for the undressed skins of oxen, horses, and other large animals, those of goats, calves, and sheep being known as skins. In the form of leather hides are used for many purposes. See Leather; Tanning.

Hieraconpolis. Greek name of the ancient city Nekhen at Kom el-Ahmar, Upper Egypt. Situated near the left bank of the Nile, 44 m. above Luxor, it was the residence of the predynastic kings of the S., and sacred to the hawk-headed god Horus. Quibell's excavations, 1897-98, yielded superb examples of early art, including a mace-head and palette of Narmer, a red-gold hawk's head, and a copper statue of Pepy I.

Hierapolis. Ancient city of Phrygia, Asia Minor. Situated near the river Maeander, above the Lycus valley, its ruins exist at the present day. It was famed for the worship of Leto or Latona. It is not to be confounded with Hierapolis (mod. Mambei) in Syria, about 50

Hierapolis. Part of the ruins of this ancient Phrygian city

Domesday, where the holdings are given in hides. Taxes were paid on the number of hides, which had little relation to the size of the holding. The tax, generally one of 2s. per hide, was known as hidage, but afterwards as carucage.

The hide was also used in Anglo-Saxon times to express a man's social standing or the value of his oath, while the unit of five hides occupied an important place in the military system of early England. In the Danish parts of England the carucate took the place of the hide. It should be said that the evidence is very conflicting, and that there were doubtless small hides of 30 acres. See Domesday Book; consult Domesday Book and Beyond, F. W. Maitland, 1897; Feudal England, J. H. Round, 1909.

m. N.E. of Aleppo, called Bamyce by the Greeks and noted for its temple to Astarte.

Hierarchy (Gr. *hieros*, sacred; *archein*, to govern). Literally, administration of sacred things. The term was first used by the 6th century writer known as Dionysius the Aeropagite, in his treatise On the Heavenly and Ecclesiastical Hierarchies. By the celestial hierarchy is meant the angels, archangels, and all the company of heaven (as in the Hymn of Praise in the Communion Service). The Jewish hierarchy included the high priest, priest, and Levite. In the Christian Church the term means the presiding officers. It is used also of any body of officials organized in ranks and orders, to define priestly government, and of classification in biology and logic.

2. .

Newburyport and Worcester, 1850-58. During the civil war he was colonel of the first regiment of freed slaves, and was wounded at Wiltown Bluff, 1863. He took an active interest in anti-slavery, educational, and women's suffrage movements. A man of striking personality, he wrote with charm and distinction the *Lives of Margaret Fuller*, Marchioness Ossoli, 1884; *Henry Longfellow*, 1903; and *J. L. Whittier*, 1903; two histories of the U.S.A., one for the young, 1875, and 1885; and books of essays and reminiscences, his works being issued in 7 vols., 1900. He died May 9, 1911.

High, THE. Familiar name for the High Street of Oxford, one of the most renowned thoroughfares in England. Similar Oxford terms are the Broad, the Turl, and the Corn (Cornmarket St.). It stretches from Magdalen Bridge (E.) to Carfax (W.), and contains buildings of Magdalen, University, Queen's, All Souls, and Brasenose Colleges, also the examination schools and the church of S. Mary.

Higham Ferrers. Mun. bor. and market town of Northants, England. It stands on the Nene, 5 m. E. of Wellingborough and 63 m. N.N.W. of London, and has a rly. station. Making footwear is the chief industry. The church of S. Mary is a fine old building, mainly 14th cent. The buildings erected by the Archbishop Chichele about 1420 include the school house in the Perpendicular style, and the Bede House. The archbishop founded a college here, now scheduled as an ancient monument. Higham was on the lands of the Ferrers family in the Middle Ages. It had a castle and became a corporate town in the 13th century. It still retains its mayor and corporation. Pop. 3,268.

High Bailiff. Official of an English county court appointed by the lord chancellor. The office is now held by the registrar of the court. See Bailiff.

Highbury. District of N. London. It is in the bor. of Islington, with a station on the elec. rly. Near the station are Highbury Fields, 27½ acres, acquired for the public in 1886 and 1891. Close by stood the original manor house,

once the property of the priors of S. John; it was partly destroyed in the Wat Tyler rising of 1381. A later building on the site was Highbury Farm, in connexion with which grew up a cake-and-ale-house known as Highbury Barn, which, after becoming a tavern with tea gardens, and an hotel with music-hall and dancing saloon, disappeared in 1871.

Highbury Barn as it appeared in 1792

To the N. is the ground of Arsenal F.C., to the E. of which is Highbury Vale. The Nonconformist club known as the Highbury Society held its meetings at Highbury Barn, 1740-1833. Joseph Chamberlain, when a boy, lived at No. 25, Highbury Place. The manor, mentioned in Domesday, belonged in turn to Thomas, Lord Cromwell; Queen Mary; Henry, son of James I.; and Charles I., who in 1629 sold it to Sir Allen Apsley.

High Commission, COURT OR. English ecclesiastical court. It was set up in 1559 to enforce greater uniformity in the services of the Church of England. Whitgift, archbishop of Canterbury, persuaded Elizabeth to delegate her powers of jurisdiction over the church to a commission of 44 persons of whom 12 were bishops. This was done on the strength of an Act of 1558 by which the ancient jurisdiction of the state, ecclesiastical and spiritual, was restored to the crown. The method of action was to request a suspected person to take an oath denying some particular proposition. The court was abolished by an act of July 5, 1641.

High Commissioner. Within the British Commonwealth, including Southern Rhodesia, this title is usually given to the chief representative of the government of one member in the territory of another member. It was also the title of the officer administering the government of Palestine, during the exercise of the British mandate. Within the British colonial empire

it is held by the officer administering Basutoland, Bechuanaland, and Swaziland; also by the officer administering the Western Pacific Islands. When it is remembered that Lord Milner in South Africa and Lords Cromer and Lloyd in Egypt held the same title, it is clear that no exact definition of status or function is possible.

High Court of Justice. English court of law, a branch of the supreme court of judicature, as established in 1873. It is divided into three divisions; chancery; king's bench; and probate, divorce, and admiralty; in addition one of its judges is detailed to preside over a court of bankruptcy, and another to deal with the winding-up of companies, both as part of the chancery division.

By the Judicature Act of 1873 every division of the high court has power to try anything that any other division may: thus, a chancery judge could try a divorce or probate suit or an action for libel. In fact, actions of a mixed common law and equity character are tried daily, but to secure the service of expert judges certain matters are started in specific divisions.

Thus common law actions for damages, for the recovery of debts, etc., should be commenced in the king's bench; actions for administration of trusts, specific performance of contracts, and for injunctions to restrain injuries to rights of property, e.g. copyright, rights of light, etc., should be brought in the chancery division; while in the probate, divorce, and admiralty division should begin those suits which the title of the division indicates. Each division of the court has its quota of judges, all appointed by the crown on the advice of the lord chancellor, all knighted on appointment, and entitled to a salary of £5,000 a year and a pension on retirement.

The lord chancellor is the president of the chancery division; the lord chief justice of the king's bench division; while the probate, divorce, and admiralty division has a president. Sittings of the high court, except those of the judges of the king's bench division when on circuit, are held at the royal courts of justice, Strand, London, W.C. See Chancery; Judge; King's Bench.

Higher Criticism. Term applied to scientific criticism of the books of the Bible. See Criticism, Biblical.

High Force. A waterfall in Teesdale in the N. Riding of Yorkshire, England, 5 m. N.W. of Middleton. The bed of the

High Force. Magnificent waterfall in Teesdale, 5 m. from Middleton, Yorks

Tees here falls 72 ft. in three steep steps, and the river, forced suddenly into a channel 10 ft. wide, leaps in a single fall into the ravine below. The surrounding country is of great beauty.

Highgate. Residential suburb of N. London. The S. part of the district is in the met. bor. of St. Pancras, and part in that of Islington; the N. part, situated on a summit, 426 ft., E. of its sister height of Hampstead (*q.v.*), is just outside the London co. boundary and in the Middlesex bor. of Hornsey. There are rail stations on the Northern Line and the line from Finsbury Park, and bus and trolley bus services.

At the foot of Highgate Hill is Whittington's Stone, on the spot where Dick Whittington is said to have sat as he heard Bow Bells chiming the refrain, Turn again, Whittington, thrice lord mayor of London. At the foot of Archway Road are the almshouses, known as Whittington College, removed from the city in 1822. Between the two thoroughfares named is the Archway hospital. On the W. side of Highgate Hill are the S. Mary Islington Infirmary; S. Joseph's Retreat, 1858-59, enlarged 1862 and 1889, mother house of the Passionist Fathers in England (its dome is a landmark); and Waterlow Park, 29 acres containing Lauderdale House, once the home of Nell Gwynn, presented to the public by Sir Sydney Waterlow in 1889, with Highgate cemetery to the W.

Open spaces, to the N., are Highgate Wood and Queen's Wood, 70 acres, public since 1886. The Village and its High Street retain something of their rural charm. Here are the Gothic parish church of S. Michael, 1832, the spire of which is a conspicuous landmark; Cromwell House, wrongly said to have been built

by the Protector for General Ireton and now headquarters of the mothercraft training centre; and Highgate School, founded in 1565 by Sir Roger Cholmeley and enlarged in 1899, the chapel of which, covering the old burial ground of Highgate Chapel, has a crypt containing the grave of Coleridge.

On West Hill is Holly Lodge, once a residence of the duchess of St. Albans and later the home of Baroness Bur-

dett-Coutts. Coleridge lived in The Grove. Other notable residents include Francis Bacon, who died in the now demolished Arundel House; several earls of Arundel, Lauderdale, Nell Gwynn, Marvell, Leigh Hunt, Arabella Stuart, Henry Sacheverell, Selina, countess of Huntingdon, Bishop Atterbury, Lord Southwood, W. Heath Robinson.

In Highgate cemetery are buried Faraday, Lord Lyndhurst, the parents of Charles Dickens, George Eliot, Karl Marx, F. D. Maurice, Christina Rossetti, and Tom Sayers.

Highgate's history goes back to the 14th century. It was once in the old forest of Middlesex, a hunting ground of Henry VIII. The bishops of London had a hunting park here, and the name is usually derived from a toll-gate erected at the top of the hill when the bishop in the 14th century allowed a road to be made through his park. Another and voluntary toll used to be levied on passing travellers, who were invited at the Toll Gate Inn and other hostleries to take the Highgate Oath, in

return for which, and expenditure on drink, they were declared free of the local liberties. In Archway Road, opened 1813, is the archway, built originally of stone to carry the old road connecting Highgate with Crouch End, and replaced by the existing steel structure in 1900. Pop. 13,400.

Highland. Term used for a tract of country standing at a considerable height above sea level. It has no reference to the structural character of the land, whether produced by folding or erosion, whether mountain chains or plateaux. In N. and S. America there are great highland systems to the W. and lower highlands to the E. Almost the whole of Africa is highland. In Europe the highlands are found in the N.W., the centre, and the S., while in Asia they cover the greater part of the S. and S.E.

In general, highland areas support fewer people than lowlands, but there are important exceptions, *e.g.* the open, grassy plateaux of S. Africa and of the Anglo-Egyptian Sudan, which are located in low latitudes, so that elevation there, by reducing the temperature, actually promotes settlement. Highlands frequently act as barriers to communication and

Highgate. The Archway, Gate, and Tavern as they were in 1825. Upper picture, the modern archway which replaced the old structure in 1900

thus hinder intercourse between peoples living on different sides of the barrier; examples of this are the Pyrenees, Caucasus, Alps, and Himalayas.

Highland areas are frequently inhabited by races driven there by stronger invaders who have taken possession of adjacent plains. In their highland homes they preserve their own language, manners, etc.

Highland Cattle. A group of this hardy breed raised chiefly in Argyllshire and the Western islands of Scotland

Highland Cattle. A breed of cattle found mainly in Argyllshire and the Western islands of Scotland. Whether it be the indigenous wild breed of the district or not, it is undoubtedly of great antiquity, and not greatly altered from the old Celtic shorthorn. It is the hardest of all British breeds, and is left largely to roam the mountains in a half-wild state and to pick up its own living. It is practically free from disease, and its beef is of high value. Its long, shaggy coat varies in colour from a creamy yellow to reddish brown and black, and it is often kept in parks for ornamental purposes. See Cattle colour plate.

Highland Development Scheme. General term applied to a series of undertakings carried out in the Highlands of Scotland with a view to increasing the country's industrial potential, particularly in the damming of rivers and lochs to provide hydro-electric power. From 1930 private enterprise was building power stations in the Highlands, notably at Loch Eriicht, at Lochaber, and at Loch Quoich. Construction met with strong opposition on the grounds that it destroyed natural amenities, while virtually all the current generated was transmitted to industrial centres, leaving only a small percentage for local farms and villages.

In 1941 all development of Highland water power became the responsibility of the North of Scotland hydro-electric board, a non-profit-earning public service corporation under the secretary for Scotland. Control of this body was incorporated in the Town and Country Planning (Interim Development) (Scotland) Act of 1944, by which land may not be developed without consent of a local planning authority. Up to 1947 the board had built or projected schemes to the value of £65,000,000, involving the construction of over

100 generating stations. Always it was laid down that local needs from any station would be met before power was supplied to other parts of Scotland. Big generating plants were at Glen Affric, Glen Shira, Glen Tarsan, Glen Lussa, and Clunie.

Highland Division. Infantry formation of the British Army. Constituted in the First Great War to include all battalions of the Highland regiments, it was reformed in 1921 as the 51st Division and composed of all the Territorial battalions of Highland regiments. It joined the B.E.F. in France in Jan., 1940, as part of 3rd corps and suffered heavy casualties in the defence of Le Havre and the retreat on Dunkirk. Trapped at St. Valery, the remnants were forced to surrender. Reformed in Britain, the div. fought throughout the N. Africa campaigns, and after service in Sicily and Italy joined 21st army group for the invasion of Europe, fighting from Falaise to the final advance on the Elbe. When the Territorial army was reorganised in April, 1947, the 51st Highland Division was amalgamated with the 52nd Lowland Division as the 51st Scottish Division (T.A.).

Highland Light Infantry. Regiment of the British army. Raised as the 71st Foot by Lord

Highland Light Infantry badge

Macleod in 1777, the regiment first saw active service at Gibraltar, where it gained the castle and key on its badge. It went to India and fought in the Carnatic and Mysore and at Assaye. Having been at the capture of the Cape of Good Hope in 1806, it served under Wellington in the Peninsula. At Waterloo it charged the Imperial Guard. Later campaigns

were in South Africa (1851-53), the Crimea, the Indian Mutiny, Egypt, 1882, including the storming of Tel-el-Kebir, and the South African War of 1899-1902, when the regiment was engaged at the Modder River and Magersfontein.

In 1880 the 74th Foot became the 2nd battalion of the Highland Light Infantry, and the regiment's kilts were replaced by tartan trews. It is now the only Highland regiment which does not wear the kilt. In the First Great War the Highland Light Infantry raised 26 battalions and earned the honours: Mons; Ypres, 1914, '15, '17, '18; Loos; Somme, 1916, '18; Arras, 1917, '18; Hindenburg Line; Gallipoli, 1915-16; Palestine, 1917, '18; Mesopotamia, 1916-18; Archangel, 1919. In the Second Great War the regiment was in action in France, E. and N. Africa, Greece, Italy, and Europe (1944). The 1st and 5th battalions took part in the assault on the island of Walcheren.

Highland Mary. Heroine of some of the noblest of the songs of Robert Burns (*g.v.*). According to the generally accepted theory her name was Mary Campbell, and she and the poet plighted troth and exchanged bibles, but marriage was prevented by her sudden death at Greenock in 1786. She was buried in the graveyard of Old West Kirk, Greenock, where a monument was erected to her memory. In 1920 her remains were reinterred in Greenock cemetery, the old burial ground having been absorbed by the extension of a shipbuilding yard. See Dunoon; consult Burns, W. E. Henley, 1898.

Highland Regiments. General name for six units of the British army which are normally recruited in the Highlands of Scotland and all of which originally wore the kilt. They are the Black Watch, or Royal Highlanders, 42nd and 73rd; Seaforth Highlanders, 72nd and 78th; Gordon Highlanders, 75th and 92nd; Cameron Highlanders, 79th; Argyll and Sutherland Highlanders, 91st and 93rd. The Highland Light Infantry, originally kilted, since 1880 have worn trews, while they are now mainly recruited in Lanarkshire. See Kilt.

Highlands, THE. Name given to that part of Scotland lying N. and W. of a line drawn from Dumbarton on the W. to Stonehaven on the E. The limitations are vague, but it is customary to exclude the coastal parts of Aberdeenshire, Nairn, Moray, and Banff, and the Orkneys and Shetlands. It thus

denotes generally the mountainous parts of the country and those, apart from Caithness and the Orkneys and Shetlands, where the Celtic race and the Gaelic speech predominate. The physical configuration of these parts, their relative inaccessibility and barrenness, and the racial characteristics of the inhabitants have combined to give the Highlands a distinctive place throughout Scottish history, and the "Highland line" still marks real differences in the life and manners of the two portions of Scotland.

Inverness is usually counted the capital of the Highlands. In the glens and other fertile tracts agri-

now with Lowlanders, now among the rival clans.

The first great step towards settling the Highlands was the Statutes of Iona, 1609, when Bishop Knox of the Isles arranged a compact with the great chiefs to regulate such matters as the maintenance of churches and clergy, the reduction of the chiefs' retinues, education, carrying of firearms, maintenance of inns, etc. Later came the road-building of General Wade, 1725, and the wholesale abolition of hereditary jurisdictions of the great chiefs, 1748. But conditions remained primitive until well on in the 19th century. Agriculture was improved by the

danger of obliteration. See Celt; Clan; Gaelic; Scotland.

HIGHLAND DRESS. A form of kilt, common in Europe in early times. It was used notably by the Romans, was common to the Irish, the Manx, the Welsh, and ancient Britons, and is still the national garb of the Albanians. In Scotland it appears on the earliest known records of that land, the sculptured stones. Among these the Dupplin Cross is cited by Skene; the St. Andrews altar slab, found 6 ft. below the ground, is referred to by Romilly Allen as bearing a figure who wears a plaid and kilt. These monuments prove that the ancient Scots, when hunting or on horse-back, wore a kilt-like dress, falling below mid-thighs, and a plaid across the shoulders. Beneath the dress the Highlanders wore what was called the *leni croich* or Highland shirt, in Ireland called the *lenn*, which it was the custom to dye with saffron.

Early Form of Dress

The Scottish dress differed from the Roman, Welsh, and, at any rate from the later forms of, the Irish and Manx kilts, in the important fact that it—an *breacan feilidh*—formed a covering for the whole upper part of the body. It consisted of a great piece of tartan cloth. This was spread out upon the floor while the owner carefully kilted, that is pleated, one end of it. He then lay down and fastened the kilted portion round his waist with a belt. The unkilted part lent itself to great diversity of arrangement; one of the commonest methods was to draw it up the back and on to the front of the shoulder, where it was fastened by a brooch of large size, ornamented generally with interlaced patterns and cairngorm stones. This arrangement left a picturesque loop at each hip. The back portion could also be formed into a cloak which covered the head. The kilted portion was shorter than is now customary in the stitched, detached kilt or *feilidh beag*.

The length of the *breacan feilidh* was probably 12 yards. The short jacket opened down the front as in the time of the ancient Britons; the hose and the broad bonnet came later. The latter, with its red *tourie*, looks as though it had been evolved from the round, oval-topped morion which is shown on the sculptured stones, notably on the Aberlemno stone.

Examination of the drawings of the Forteviot stone, which is probably as ancient as its model-

Highlands. Panorama of the Breadalbane Range, Perthshire, from the summit of Ben Lawers: a typical Scottish hill scene

Robert M. Adam

culture is carried on, mostly in small-scale farming; the croft system prevails in many of the remoter districts. Sheep rearing is of great importance, sturdy hill sheep, especially of the black-faced varieties, being bred in large numbers. The grouse moors, deer forests, and salmon fisheries are of economic importance, and, apart from the wealthy classes who enjoy these sports, the summer months bring tourists to Oban, Pitlochry, Kingussie, and Strathpeffer.

The earliest history of the Highlands is obscure; neither ethnologists nor antiquarians have determined the precise development of the possibly Iberian dwellers of prehistoric times, of the Goidels, Caledonians, and Picts or Cruithnigh. The coming of S. Columba to Iona, A.D. 563, marks the beginnings of Christianity in the Highlands, but their history throughout the Middle Ages and the following centuries is a long record of confused wars, now with Norsemen,

Highland and Agricultural Society, founded 1784; but prolonged emigration, and the great "clearances" of crofting areas to make room for sheep-runs in the early 19th century, left results which are still felt in some districts. Thus it is not uncommon to find glens which now hold a mere handful of inhabitants, where formerly, as the remains of cottages and sheilings attest, scores of families were able to subsist.

The spread of education and improved transport facilities have greatly modified the distinctive life of the old Highlanders, but the Gaelic tongue survives in many parts, particularly in the W., either alone or side by side with English. The Celtic customs and folklore are not forgotten, and the Highland gatherings, e.g. of Braemar or Blair Atholl, foster the old pipe-music, dances, and sports. Indeed, recent years have seen a marked revival of the old language, music, and traditions which were in

Highland Dress, as worn by: 1. The Campbells of Breadalbane; tartan, green with double stripes of yellow. 2. The MacDonalds of Clan Ranald; tartan, dark and light green with red stripes; the figure is armed with sword and leather target. 3. The Camerons in the 18th century; tartan, red with green and white stripes

ling is primitive and crude, brought the writer to the conclusion that the figure portrayed is wearing a "Glengarry" with a decoration along the front, where we now place the *dam brod* or chequers. At the back a tuft of hair is showing, and round this flow what look like the tails of a bonnet. The Glengarry shape may have descended from the cap of maintenance. The truis or trews (skin-tight breeches) are as ancient as the plaid. Similar truis were worn by the most servile class in ancient Ireland, and amongst the Britons. They were probably inherited from the slaves who, amongst the Gaels, were either of the conquered earlier race, or Gaels who had lost their rank as freemen.

The modern form of kilt, or *feilidh beag* (i.e. little covering), can be traced to 1626, when it appears on the arms of the Burnetts of Leys. The feathers worn in the Highland bonnet were, says General Stewart (1822), a privilege accorded as a token of gentility. The jacket and the hose were also of tartan, as were the trews. The hose were often made without feet, and were in that case known as *mogans*. The *bhrogan* (vrogan), i.e. shoes, were cut to the actual shape of the foot, and had holes in them for the escape of water. The *breacan feilidh* was common to the greater part of Scotland, and after the conquest of the Lothians, if it had ever died out there, which is doubtful, became common to all Lowland Scotland. Part of

it, the plaid and braid, or Kilmarnock Tam o' Shanter, actually lingered there till the 20th century, though now seldom seen. The Highland dress was proscribed by Act of Parliament in 1747, but the Act was repealed amid great rejoicing in 1786. See Bagpipes; Celt; consult Highland Dress, Arms and Ornament, Lord Archibald Campbell, 1899. **McKenzie McBride**

Highness. Title of honour applied to English sovereigns until the reign of James I, when Majesty became the official style. In the British royal family, Royal Highness is used for children of the sovereign, and for his or her brothers, sisters, uncles, aunts, grandchildren, if children of sons, and great-grandchildren, if children of the eldest son of a prince of Wales; nephews, nieces, cousins, and children of daughters are called Highness, but Prince Charles, son, and Prince Philip, husband, of the heiress presumptive are H.R.H.

High Priest. Head or chief priest of the Jewish Church. From Aaron, to whom priestly authority was delegated by Moses, the office descended by primogeniture. There appear to have been about 80 high priests beginning with Aaron and ending with Phannius, but the direct Aaronic line ended with Eleazar. Their history covers a period of about 1,370 years. Their consecration was attended by elaborate ritual, their dress was distinctive, and their duties included the privilege of entering the

Sanctuary on the Great Day of Atonement to make propitiation. Details of their consecration, etc., are given in Exodus, Leviticus, and Numbers. See Aaron; Breastplate; Ephod; Priest; consult also Josephus's Antiquities of the Jews.

High Seas. Those parts of the ocean not under any territorial sovereignty, being more than 3 m. from shore. Germany called her fleet of the First Great War the high seas fleet. See Freedom of the Seas.

High Sheriff (A.S. *scire gerefa*, reeve, or officer of the shire). One of the principal subordinate magistrates in England to whom the custody of the county is committed by the crown by warrant under the hand of the clerk of the privy council. In some counties the office was anciently hereditary, in others elective, subject to the royal approval. To obviate the inconveniences of popular election, a statute of Edward II enacted that the sheriffs should be assigned by the chancellor, treasurer, and judges; and since the reign of Henry VI the custom has been for all the judges, with the other great officers and privy councillors, to meet in the exchequer on the morrow of S. Martin, and to propose three persons to be reported, if approved, to the sovereign, who afterwards picks one of them, i.e. appoints him sheriff.

Formerly the powers and duties of the high sheriff were very great in his fourfold capacity of judge,

keeper of the peace, ministerial officer of the superior courts of justice, and bailiff of the sovereign. In modern times his duties are mainly performed by an under-sheriff, who is usually a solicitor, and the high sheriff is the chief personage of the county who receives the judges on circuit, acts as returning officer at elections, executes civil judgements, and sees to the due carrying out of the death sentence. Sheriffs hold office for a year, and no man who has served can be compelled to serve again within three years. *See County; Sheriff.*

High Tor. Hill in Derbyshire, England. It is on the left bank of the Derwent, between Matlock and

High Tor, Derbyshire, seen from the banks of the river Derwent

Matlock Bath, and is a sheer mass 380 ft. high. On the other side of the pass, which it helps to form, are the Heights of Abraham. Beneath the hill is High Tor grotto, famous for its crystallisations.

High Water. Term used for the normally highest limit of the rise of the tide in the sea or river, and for the time of such rise. High water at any particular place by the sea happens on the average every 12 hrs. 25 mins., so that it becomes 50 mins. later each day. Successive high waters are often not of the same height, and vary considerably according to the phases of the moon and the lie of the land. High water level in rivers is usually the highest flood level.

Highway. In English law, any way along which the public are entitled to pass. A public footpath is thus a highway. Formerly the inhabitants of each parish were required to keep in repair their own highways, each parish having to appoint surveyors of highways. Such a system may have been satisfactory when road traffic was small and local.

The Highway Act, 1835, retained the surveyor of highways

for each parish but added a district surveyor for a group of parishes and a highway board for densely populated parishes. Since that time the responsibility for repair has been increasingly centralised. Highways are now classed as trunk roads, county roads, or ordinary highways.

Trunk roads, the principal national thoroughfares, are repaired by the ministry of Transport. County roads—i.e. other main roads—in a borough are repaired by the borough council, and elsewhere by the county council. Ordinary highways in a borough are likewise repaired by its council; within an urban district, by that council; elsewhere by the county council.

No one may be under any liability to repair highways dedicated to the public since 1835. *See Road.*

Highway Code, THE. Official code of conduct for road users in Great Britain, pedestrians as well as motorists and cyclists. The first Highway Code was issued

by the ministry of Transport in 1931, over 5,000,000 copies being distributed; later editions, intended to help lower the toll of road accidents, had an even wider distribution, and in 1946 a completely rewritten booklet was designed for every home. Although the code has no legal status, it includes a summary of the principal clauses of the Road Traffic Acts.

Highwayman. Name given to the mounted robbers who infested the public roads in England from the first half of the 17th century

until the early 19th. In literature the highwayman was a familiar figure, for which Falstaff suggested such poetical designations as "Diana's foresters, gentlemen of the shade, minions of the moon."

Among well-known highwaymen is Claude Duval (1643-70), who is remembered by the episode depicted in W. F. Frith's painting, where he is dancing a coranto with a lady, whose husband, after paying £100 for the entertainment, has been allowed by the gallant highwayman to keep the remaining £300 in his bag; another is Dick Turpin (1706-39).

To these may be added John or William Nevison (1639-1684), nicknamed "Swift Nicks" by Charles II; John Cottington (1611-1656), called "Mulled Sack" from his favourite beverage, who held up the army pay wagon on Shotover Hill and decamped with £4,000; Jack Rann (d. 1774), the dandy highwayman, nicknamed "Sixteen-String Jack" from the bunches of ribbons at his knees; and Louis Jeremiah Abershaw or Avershawe (c. 1773-1795), commonly known as Jerry Abershaw.

High Willhays. Mt. of Devon, England. It is 4 m. S. of Okehampton, and is the highest point on Dartmoor, 2,039 ft.

High Wycombe OR CHIPPING WYCOMBE. Mun. bor. and market town of Bucks, England. It lies

High Wycombe arms

27 m. W.N.W. of London, at the foot of the Chiltern Hills, in a valley through which pass mainly lines from Paddington and Marylebone. The earliest charter was granted in 1237.

The parish church, the largest in the co., was founded in the 11th century, has 13th-16th century remains, and was restored in 1893

High Wycombe, Bucks. The market place, showing, left, the Guildhall, designed by the Adam brothers in 1757; right, the octagonal Little Market House, which dates from 1604, and the parish church of All Saints

Wycombe Abbey school is a famous public school for girls.

The Little Market House dates from 1604, and the guildhall from 1757. A civic centre comprises town hall, municipal offices, and police station. Near by are Hughenden, in 1839-81 the home of the earl of Beaconsfield, and Penn, the supposed birthplace of William Penn. High Wycombe makes furniture and paper, and engages in light engineering. It is included in the co. constituency of Wycombe. Pop. 27,987.

Hiin or **Hiiumaa** (Estonian *maa*, island). The Estonian name for the Baltic island described in this work as Dagö (*q.v.*).

Hiking. Tramping about the countryside for pleasure or exercise. The etymology of the word is doubtful, but it appears to be derived from an old English dialect term with several local meanings; in Northants it describes a swinging gait. Early in the 20th century it was adopted by boy scouts in the New England states of the U.S.A. to describe their cross-country journeys on foot, carrying their own baggage. British boy scouts were the first to bring the word back to its country of origin. After the First Great War country walking enjoyed a wide popularity in Great Britain as a means of spending a cheap holiday; and the term hiker came to be applied to those who toured from place to place on foot, carrying their personal luggage on their backs. The hiker is distinct from the Rambler, who restricts his pedestrianism to short walks, usually combined with nature or historical study.

Hilary or **HILARIUS** (c. 300-368). French bishop and saint. Born at Poitiers, France, the son of pagan parents of high social standing, he was converted to Christianity c. 350. Chosen bishop of his native city c. 353, probably from the rank of a laic, he became famous as an opponent of Arianism. He was banished to Phrygia by the Emperor Constantius, 356-360. He died at Poitiers, Jan. 13, 368, and was declared a doctor of the Church by Pius IX, 1851.

Hilary's writings included a History of Synods, a survey of the councils of the East on Arianism; a defence of the Nicene faith, addressed among others to the British bishops; a work of permanent value on the Trinity, defining the philosophic doctrine of the divinity of Christ, a smaller tractate against the Arians, and hymns, now lost. His festival is kept Jan. 14. The village and

church of S. Hilary, Cornwall, are named in his memory.

The name Hilary sittings, peculiar to the English law courts, is a survival of Hilary term (Jan. 11-Jan. 31), named after the festival of the saint, and one of the four terms of the legal year, for which Hilary sittings was substituted in 1873. These sittings begin on Jan. 11 and end on the Wednesday before Easter. In the Inns of Court (*q.v.*), Hilary is one of the four dining terms, Jan. 11-Feb. 1. Hilary term is the name given at Oxford university to the term which begins on Jan. 14 and lasts until the Saturday preceding Palm Sunday. *See* Term.

Hilda or **HILD** (614-680). English abbess and saint. Daughter of Hereric, a nephew of King Edwin of Northumbria, and baptized by Paulinus in 627, she adopted the monastic habit when 33 and went to East Anglia with a view to emulating the example of her sister, Hereswid, a nun of Chelles, near Paris. She became abbess of Hartlepool, and in 657 founded the Benedictine abbey at Whitby where, as at Hartlepool, she presided over a community of men and women. Here she received the poet Caedmon (*q.v.*), who, under her advice, became a monk; her counsel was sought by some of the most influential people in the country. Shortly after founding a monastery at Hackness, she died at Whitby, Nov. 17, 680. *Consuli Vita Sanctae Hildae*, A. D. H. Leadman, 1902; Dictionary of Saintly Women, A. B. C. Dunbar, 1904.

Hildebrand. Name of Gregory VII (*q.v.*) before he was chosen pope. Of Teutonic origin, it means battle-sword, and appears in the Nibelungen Lied. It is occasionally used as a Christian name today.

Hildesheim. City of Lower Saxony, West Germany. Once a perfect specimen of medieval architecture, it was a ruin when the U.S. 9th army reached it April 9, 1945, during the Second Great War. It is situated 18 m. S.S.E. of Hanover, on the small river Innerste, surrounded by low, wooded hills. It was a rly. junction and an inland port connected with Germany's main canal, also an airport. There were factories for heating, laundry, agricultural machinery, and rubber, and bell and iron foundries.

Its main interest, however, was the well-preserved inner town, with Romanesque, early Gothic, and timber-frame buildings, hundreds of which, with richly carved and

Hildesheim. The Roland Hospital, with carved beams and panels, built in 1811

often painted fronts, faithfully rendered the scene of a German town of from 4 to 6 centuries ago. Outstanding among those buildings were the three Romanesque basilicas, S. Michael's (1010-36), the Catholic cathedral (1050) with a bronze door, and valuable old sculptures, and S. Godehard's (1113-90); S. Magdalen's (13th century), S. Andrew's (1100, enlarged 1415), S. Cross (11th cent., Baroque reconstruction 18th cent.), S. James's (1504) with a famous organ, and S. Maurice's (11th cent.). The town hall, the Tempel's, the Imperial, and the rich Knochenhauer-Amt houses, all 13th to 16th century, a Roland fountain, and scores of other famous buildings, the Roemer and other museums, schools, theatre, and learned societies contributed to Hildesheim's unique atmosphere. Only S. Maurice's church remained intact after the Second Great War. S. Godehard's was repaired. Most of the city's movable treasures had been evacuated and were saved.

The town was founded as a bishopric in 815 A.D., prospered between 1000 and 1500, was recognized as a sovereign chapter in 1235, and became a Hanseatic town; it suffered from dynastic, and, after the Reformation, from religious wars, fell in 1802 to Prussia, in 1807 to the short-lived kingdom of Westphalia, in 1813 to Hanover with which it remained, being during 1866-1945 under Prussia. It was in the British zone of occupation after the Second Great War. Pop. 62,519.

Hill, ROWLAND HILL, 1st VISCOUNT (1772-1842). British soldier. Born at Prees Hall, near

1st Viscount Hill,
British soldier
After W. Haines

being in command of the 90th regiment. During the Peninsular War he was present at most of the chief battles, and at the end of the war was one of the five of Wellington's chief officers honoured with a peerage in 1814. He also did notable service at Waterloo. He was commander-in-chief from 1823 to 1842; in the latter year he was created Viscount Hill. He died Dec. 10, 1842.

HILL, ARCHIBALD VIVIAN (b. 1886). British physiologist. Born Sept. 26, 1886, he was educated at Blundell's and Trinity College, Cambridge. A fellow of Trinity College, 1910-16, Brackenbury prof. of physiology in Manchester university, and Foulerton research prof. from 1926, he was elected F.R.S. 1918 and was secretary of the Royal Society, 1935-45. He gained the Nobel prize for physiology and medicine, 1922. During the Second Great War he was chairman of the executive committee of the national research laboratory, and a member of the war cabinet scientific advisory committee and other scientific committees, his particular concern being air defence. Hill was Independent Conservative M.P. for Cambridge university, 1940-45; he was made C.H. 1946. He published *Living Machinery*, 1927, and monographs and papers in scientific journals.

HILL, SIR ARTHUR WILLIAM (1875-1941). A British botanist. Born Oct. 11, 1875, he was educated at Marlborough and King's College, Cambridge, where he proved a brilliant student in the natural sciences. Senior demonstrator, 1899, and university lecturer in botany, 1905-07, he was assistant director of the royal botanic gardens, Kew, 1907-22, director, 1922, until his death in a riding accident Nov. 3, 1941. His special interest was plant morphology; he published many papers on this and other aspects of botany. He also encouraged interchange of knowledge with other botanical stations of the British Commonwealth. Hill, who was an F.R.S., was knighted in 1931.

HILL, DAVID JAYNE (1850-1932). American historian. Born in New Jersey, June 10, 1850, he was educated at Bucknell university and in Paris and Berlin. He became an authority on diplomacy and international law, and in 1899 was appointed prof. of European diplomacy in the school of comparative jurisprudence at Washington, and also an assistant secretary of state. From 1903 to 1911 he was successively U.S. ambassador in Switzerland, the Netherlands, and Germany. He was a member of the Hague tribunal and a delegate to the second peace conference at The Hague in 1907. He wrote a number of books on diplomacy, among them *A History of Diplomacy in the International Development of Europe*, 6 vols., 1905; *The Establishment of Territorial Sovereignty*, 1906; *The Problem of a World Court*, 1927. Died March 2, 1932.

HILL, DAVID OCTAVIUS (1802-1870). Scottish artist and pioneer of photography. Born at Perth in 1802, he received his early artistic training under Andrew Wilson, superintendent of the school of art at Edinburgh, and exhibited his first picture 1823. In 1830 he became secretary to the Edinburgh society of artists, later the Royal Scottish Academy, a post he held until a few months before his death. In 1841 he published a series of sixty pictures engraved from oils illustrating the Burns country, and in 1843 began his great historical picture, *Signing the Deed of Demission*, which contained 500 portraits of the leading lay and clerical members who took part in the ceremony; it was completed in 1865, and is now in the free church assembly hall, Edinburgh. His works were all admirably suited for engraving, and he is better known by reproductions through this medium than by his original paintings.

On the advice of Sir David Brewster (*q.v.*) Hill interested himself in the photographic experiments then being made by Robert Adamson. Hill was the first to apply the new art to portraiture, and, despite the crude quality of the material then available, turned out portraits that have seldom been surpassed. Many of the calotypes of eminent men which he took are still in existence, one of his most notable studies being that of R. S. Rintoul, taken in 1845. He was also the first artist to use photography as an aid (for *Signing the Deed of Demission*) in portraiture. Hill

founded the art union of Edinburgh, the first of its kind in Britain, and was a commissioner of the National Gallery of Scotland.

HILL, FLORENCE DAVENPORT (1829-1919). A British reformer. As a girl she assisted her father,

Florence D. Hill,
British reformer
Elliott & Fry

Matthew D. Hill, recorder of Birmingham, in his campaign and writings to promote the establishment of reformatories for juvenile offenders. In her book *Children of the State*, 1868, she urged the abolition of the old system of herding destitute children in work-houses. In the early seventies she became one of the first women poor law guardians, and in 1908 drafted the bill, passed into law, setting up children's courts. She also took a great interest in the movement for women's suffrage. She died Nov. 2, 1919.

HILL, JAMES JEROME (1838-1916). American rly. magnate. Born in Ontario, Sept. 16, 1838, he graduated at Yale and in 1856-65 was employed in clerical work in St. Paul, Minnesota. In the latter year he became agent of the N.W. Packet co. and in 1870 organized the Red River Transport co., by which communication was established between St. Paul and Winnipeg. During 1879-90 he controlled the St. Paul, Minneapolis, and Manitoba railroad, which he had founded, and on its incorporation with the Great Northern became president of the latter, which, with its transcontinental line to Puget Sound, ran a steamship line to China and Japan. Hill controlled many large railway and banking enterprises. He died May 29, 1916.

HILL, JOHN (c. 1716-75). British quack doctor. An unsuccessful apothecary with a leaning towards literature, in 1746 he produced *The British Magazine*, and on the death of this journal contributed a series of gossiping letters signed *The Inspector to The London Advertiser*, which gained him a certain reputation. Running foul of Fielding, he drew on himself a severe castigation in the latter's *Covent Garden Journal*, 1752; he also abused Garrick, Woodward the actor, and Christopher Smart. In 1759 he returned to his herbal studies and began *The Vegetable System*, an undertaking which reduced him to poverty, and he

turned to quack doctoring for a livelihood. He died Nov. 21, 1775. His life's work may be summed up in Garrick's epigram:

For physis and farces his equal there
scarce is,
His farces are physis, his physis a
farce is.

Hill, Sir Leonard Erskine (b. 1866). A British physiologist. The son of G. Birkbeck Hill, he was born June 2, 1866. Educated at Haileybury and University College, London, he became professor of physiology in the London Hospital. He was a member of the navy and army medical advisory boards. Among other works he wrote *Physiology and Pathology of the Cerebral Circulation*, 1896; *Manual of Physiology*, 1899; *Physiology for Beginners* 1902; *Text-book of Physiology*, 1919; A fellow of the Royal Society, he was knighted 1930.

Hill, Octavia (1838-1912). British philanthropist. She received her education at home, and early

undertook the management of homes for the poor people in London. Among her numerous charitable and social activities were efforts on behalf of women's university settlements, and the

preservation of the public commons and of places of historic interest. She was connected almost from the first with the Charity Organisation and Kyrle societies. She was a member of the royal commission on the poor law, 1905. Among her published works were *Homes of the London Poor*, and *Our Common Land*. She died Aug. 13, 1912. Consult Octavia Hill, letters ed. by E. S. Maurice, 1928; *Life*, E. Moberly Bell, 1942.

Hill, Sir Rowland (1795-1879). British reformer. Born at Kidderminster, Dec. 3, 1795, he was for some time engaged in teaching, after which he devoted his attention to matters of social and public interest. In 1837 he published a pamphlet entitled *Post Office Re-*

form, in which he advocated a uniform rate of postage at a penny a half ounce prepaid by an adhesive stamp. Despite opposition, an act carried through parliament in 1839 brought the introduction of penny postage on Jan. 10, 1840. A change of government next year led to Hill's dismissal in 1842. Public appreciation, however, was expressed in the subscription of £13,000 presented to him, 1846. He was appointed secretary to the postmaster-general 1847-54, secretary to the post office 1854-64. He was made K.C.B. in 1860. He died at Hampstead, Aug. 27, 1879.

Hill, Rowland (1744-1833). English preacher. Born at Hawkstone Park, Aug. 12, 1744, the son

of Sir Rowland Hill, Bart. (d. 1783), he was educated at Eton and St. John's College, Cambridge. In 1773 he became curate at Kingston, Somerset, being then in deacon's orders. Rejected for the priesthood owing to his eccentricity, he continued to preach about the country as one of the numerous and nominal chaplains to Selina, Lady Huntingdon (q.v.). In 1783 he began a ministry at Surrey chapel, Blackfriars Road, London, built by himself, where he attracted large congregations. He died April 11, 1833. His book, *Village Dialogues*, went through numerous editions.

Hill 60. Name, derived from a military map reference, which was given during the First Great War to a low, almost invisible eminence, 2½ m. S.E. of Ypres, Belgium. Hill 60 was of tactical importance, as fire from it enfiladed the British position in the Ypres salient, and the summit gave the Germans good observation of British movements and dispositions. On April 17, 1915, the Royal Engineers exploded six mines under the hill, and the crest was captured by the infantry. It was held at heavy cost until May 5, when the Germans by gas attack retook all but the W. slope. It was recovered by the British in the operations for the Messines Ridge, but again fell after the German offensive on the Lys, remaining in enemy hands until the Allied advance of Sept., 1918. In 1920 the site of Hill 60 was purchased as a war memorial.

The term was also applied to a hill in the N. part of the Sari

Bair range on the Gallipoli peninsula. On Aug. 21, 1915, Australian infantry captured the hill, enabling the British to form a continuous trench line.

Hill 70. Name, derived from a military map reference, which was given during the First Great War to a hill 230 ft. high in the dept. of Pas-de-Calais, France, giving artillery domination over Lens. A main objective in the battle of Loos, 1915, it was captured on Sept. 25 by the 15th Scottish div., but the position N. of it was lost next day. The Guards made a brilliant attack on the hill and retook the ground N., Sept. 27-28. The hill, the greater part of which was left in German possession, was finally seized by Canadian troops in Aug., 1917. See Loos, Battle of.

The term Hill 70 was also applied to a hill on the Gallipoli peninsula, 3 m. E. of Suvla Bay. Also known as Scimitar Hill, it was the objective in the second phase of the Suvla operations, and after an unsuccessful assault by infantry, was captured by yeomanry, Aug. 21, 1915; but the position was abandoned by the British the same night. See Suvla Bay.

Hilla or **Hilleh**. A town of Iraq. Situated on the Lower Euphrates, and built amid the ruins of Babylon, it is about 60 m. S. of Bagdad on the rly. from Bagdad to Basra. Kerbelah lies a few miles N.W. and Nejef about the same distance S.W. of it, and it is much frequented by Shiah pilgrims on their way to those Holy Cities. Pop. about 30,000. It gives its name to a liwa (dist.) which has a pop. of 263,837.

There is another Hilla in Saudi Arabia, on the E. slope of the Jebel Tuwalik.

Hiller, Wendy (b. 1912). British actress. Born at Bramhall, Cheshire, Aug. 15, 1912, she was educated at Bexhill. She joined the Manchester repertory theatre, making her debut there in *The Ware Case*, 1930, and toured in Sir Barry Jackson's company. She first appeared on the London stage in *Love on the Dole*, 1935, repeating her performance in New York the following year. After playing in Shaw repertory at Malvern festival, 1936, she appeared in a revival of *The Cradle Song*, 1943, in *The First Gentleman*, 1945-46, and in *The Heiress*, in New York (1949) and London (1950). She achieved international fame as Eliza Doolittle in a film of Shaw's *Pygmalion*, 1939, and as his Major Barbara

(film), 1941. Her later pictures included *I Know Where I'm Going*, 1946.

Hill-fort. Stronghold erected upon the summit of a natural eminence. Developed in the late Neolithic and early metal ages, sometimes for occasional refuge rather than continuous occupation, many thousands are scattered throughout the United Kingdom. They usually comprise artificial ramparts following the contour of hilltops, and utilising natural defences where they exist. In England and Ireland they are usually of earthwork, in Wales and Scotland more commonly of stone.

Notable examples are those on the Herefordshire Beacon near Malvern; Chanctonbury Hill, Sussex; Hembury Fort, Devon; Pillesdon Pen and Maiden Castle, Dorset; Castle-an-Dinas and the drystone Carn Brea, Cornwall; and Tre'r Ceiri, Carnarvonshire. Some of them were adapted to Roman, Saxon, and even Norman use. Similar earthworks in Ireland are called raths, as on Tara Hill, co. Meath. The Aran Isles, off Galway, contain some superb stone forts which—as in N. Scotland—are called duns.

Hill-forts arose in ancient Palestine, as at Gezer, and were greatly developed by the ancient and medieval military communities of Europe and Asia, being found from the Pyrenees to the Indo-Afghan frontier, with Neolithic examples in the Deccan. There are hundreds of them in New Zealand, with palisaded ramparts and ditches. Primitive strongholds were sometimes established in such commanding situations that they gave birth to some of the world's greatest cities, such as Jerusalem, Athens, Rome, Edinburgh. See Dun; Rath; Vitruvian Fort.

Hillhead. Parish and former burgh of Lanarkshire, Scotland. It was incorporated in the city of Glasgow, of which it formed a residential suburb, in 1891. Glasgow university is in Hillhead, which gives its name to a burgh constituency of Glasgow.

Hilliard, NICHOLAS (1537–1619). English artist. Born at Exeter, he was appointed goldsmith, carver, and limner to Queen Elizabeth, and became probably the first English miniaturist. He later worked for James I, who gave him a monopoly as royal portraitist in 1617. Hilliard's miniatures, much influenced by Holbein, are remarkable for precise detail and beauty

of colour and design, and he is important as being the founder of the English miniature school. He died Jan. 7, 1619, his patent passing to his son, Lawrence (d. 1640), who worked also for Charles I. Lawrence Hilliard's miniatures are highly prized. Consult Lecture on Nicholas Hilliard, J. Pope-Hennessy, 1949.

Hillman, SIDNEY (1887–1946). American labour leader. Born at Zagare, Russia, of Jewish parents, he took part in the abortive revolution of 1905, and spent several months in prison. Coming to England, he worked in a Manchester store. Moving to the U.S.A., 1907, he found work in Chicago, where he formed a group of fellow-artisans from Europe into a union, the amalgamated clothing workers, with himself as president. With John L. Lewis he founded the committee (later congress) of industrial organizations of which he was national chairman. He was an ardent supporter of the New Deal, and became F. D. Roosevelt's chief labour adviser in organizing the national defence programme during the Second Great War. In 1944, through his political action committee of the C.I.O., he contributed much to Roosevelt's re-election as president. He helped to draw up the constitution of the world federation of trade unions, formed 1945. He died at Point Lookout, Long Island, July 10, 1946.

Hillsborough. Market town of co. Down, N. Ireland. It is 12 m. from Belfast, and is served by rly. and the Lagan Canal. The chief industry is the linen manufacture. Here is Government House, residence of the governor of Northern Ireland. Formerly known as Hillsborough Castle, this house was once the seat of the marquess of Downshire. Pop. 580.

Hillsborough, a suburb and bor. constituency of Sheffield, includes the ground of Sheffield Wednesday football club.

Hilo. Town of the territory of Hawaii (q.v.), on the island of Hawaii. Situated on the E. side of the island on Hilo Bay, it has the best harbour in the islands and is second only to the capital, Honolulu, in size. It is within 40 m. of the active volcano, Mauna Loa, 35 m. of the quiescent volcano, Mauna Kea, the loftiest peak in the Pacific, and 30 m. of another, Kilauea. Surrounded by lava fields and forests, it is a favourite tourist centre. It has a lighthouse. Pop. 23,353.

Hilton, JAMES (b. 1900). British novelist. Born Sept. 9, 1900, he was educated at Leys School and Christ's College, Cambridge. His first novel, *Catherine Herself*, was published in 1920, and with the appearance of *Lost Horizon* (q.v.), which was awarded the Hawthornden prize, 1934,

James Hilton,
British novelist

he achieved international fame as an imaginative writer. His other novels included *Knight Without Armour*, 1933; *Goodbye, Mr. Chips*, 1934 (dramatised 1938); *Random Harvest*, 1941; *The Story of Dr. Wassell*, 1944; *So Well Remembered*, 1946; film versions were made of all these, also of *Lost Horizon*.

Hilton, JOHN (1880–1943). A British statistician and broadcaster. Son of a postman, he was

John Hilton,
British statistician
and broadcaster

born at Bolton, Dec. 28, 1880, and was educated at the grammar school and at evening classes there. As a young man he became manager of a loom-fitting firm. In 1913 he was chosen by Norman Angell as lecturer under the Garton foundation. During the First Great War he examined the methods of German food control, and his researches were the basis of British rationing. He later became director of statistics at the ministry of Labour, and travelled all over the world, studying conditions. He began to broadcast in 1934, becoming increasingly well-known in this sphere as a friendly speaker on all manner of human problems. He held the chair of industrial relations at Cambridge, 1931–43, and was director of home publicity, ministry of Information, 1939–40. Hilton died Aug. 28, 1943.

Hilversum. Town of the Netherlands, in the prov. of N. Holland. It lies 18 m. by rly. E.S.E. of Amsterdam, and is a favourite summer resort. It is the junction for Amersfoort, and is connected by steam tramway with Huizen and Laren. Here is the principal broadcasting station of

the Netherlands, and notable among the fine examples of modern architecture in the town are the broadcasting station and the town hall. Pop. 80,242.

Himachal Union OR **HIMACHAL PRADESH**. Amalgamation of 21 states within the Union of India, formed April 15, 1948. It consists of the former Punjab hill states of Baghal, Baghat, Balsan, Basha, Bhajji, Bija, Darkoti, Dhami, Jubbal, Keonthal, Kumarhsain, Kunihar, Kuthar, Mahlog, Sangri, Mangal, Sirumur, Tharoch, Chamba, Mandi, and Suket; and is administered by the central govt. of India. It has an area of 10,600 sq. m. Simla is the capital. Pop. over 1,000,000.

Himalaya OR **HIMMALEH MOUNTAINS** (Sanskrit, abode of snow). Vast mountain system of Central Asia, containing the loftiest peaks in the world. From the Hindu Kush and the Pamirs, the mountains trend S.E. through Kashmir, and along the frontiers of the United Provinces, Nepal, Sikkim, and Bhutan, forming a stupendous barrier between N. India and the high plateau land of Tibet. Thus they may be said to stretch from the confines of Afghanistan to Upper Burma, as the Brahmaputra is regarded as the eastern limit. They occupy a vast area extending between lat. 27° and 35° N., and long. 72° and 96° E., and are the south-easternmost of the ranges radiating from the Pamir plateau.

The extreme length from W. to E. is about 1,550 m., and the breadth averages 200 m. They must be regarded not as a single range, but rather as a series of parallel chains running diagonally to the general trend of the system. There are also transverse sections form-

Himalaya Mountains. View from Mount Phalut, Darjeeling, of a portion of the range of everlastingly snow-clad peaks

ing knots or jumbles of snow-clad summits, separated by gorges, elevated plateaux, and valleys, the cradle of many streams and rivers, which are fed by the melting snows of the mountains and flow turbulently through deep chasms.

There are fertile and highly cultivated tracts at the base of the mountains on the Bhutan and Nepalese borders, and also a marshy and wooded region known as the Terai, which extends for about 500 m. along the N. frontier of India and Nepal, terminating to the E. of the spot whence the Ganges issues from the heights.

This swampy and unhealthy tract, the home of virulent fevers, is separated from the foothills by a boulder-strewn and scrubby belt, called the Bhabar. Much of it is wildly overgrown, and the streams emanating from the higher ground percolate through the sandy soil to feed the streams that wind about the swampy Terai. Above the Bhabar are the Siwalik Hills (*g.v.*), which reach an alt. of 4,000 ft., and beyond them again the giants of the system rear their summits.

The average alt. of the Himalayas has been estimated at between

16,500 ft. and 18,000 ft., but there are many summits rising to a height of over 24,000 ft. The highest point known on the globe, Mt. Everest, which lies on the borders of Tibet and Nepal, reaches the immense altitude of 5½ m. Much of the system is still unexplored, and it is conjectured that there may be other summits of even higher alt. A series of expeditions on foot between 1921 and 1938, and an air expedition in 1933, added considerably to knowledge of Everest (*g.v.*) and its environs. Other gigantic summits are Dhaulagiri, 26,828 ft., and Kinchinjunga, with an alt. of 28,146 ft., both in the central part of the system. Chumalhari, in the E., is 23,997 ft. high. If the Karakoram or Muztagh range be included, as it often is, in the Himalayan system, Mt. Godwin Austen, formerly known as Dapsang or Peak K2, may be mentioned, which has an alt. of 28,278 ft., and is second only to Mt. Everest itself.

Among the numerous passes, the loftiest is Ibi-Gamin, which reaches 20,460 ft., N.W. of the giant peak of Nanda-Devi; others are the

Himalaya Mountains. Map of the great mountain system which divides the sub-continent of India from the main part of Central Asia, and contains the world's highest points

Muztagh Pass, with an alt. of 19,030 ft., Mana Pass, Bara Lacha, the Parang Pass, and the Chang, all exceeding 16,000 ft. They are all difficult to cross, and the conditions prevailing are semi-arctic. They are mainly used by Indian and Tibetan traders, who load their goods on yaks and goats and are often attacked by mountain sickness in the higher altitudes. No heavy loads can be carried over these passes, so that the goods exchanged between India and Tibet are necessarily light.

Lakes and Rivers

There are few lakes of any importance throughout the system, the chief being the Palti or Yamrok with a circuit of 46 m., which lies N. of Sikkim. The snow-line on the southern face is found at 16,300 ft., while on the northern or Tibetan side it is 17,400 ft. Some of the extensive glaciers, however, descend to as low a level as 11,000 ft. The principal rivers taking their rise from the melting snows of this gigantic rampart are the Ganges, Indus, Jumna, Sutlej, and Brahmaputra, besides hundreds of minor streams. Nearly all these streams carry down tremendous loads of alluvium which have served gradually to build up the stoneless Indo-Gangetic plain, and which now add greatly to the productivity of the areas irrigated from the numerous canals of the Punjab and the United Provinces.

Tropical vegetation may be found up to a height of 3,000 ft., and includes giant rhododendrons, acacias, orchids, palms, and ferns, while tea and cinchona are cultivated. Oaks and chestnuts flourish for another 4,000 ft., after which pine, poplar, spruce, fir, birch, and willow follow to the limit of the tree-line, which on the Tibetan slopes is about 14,000 ft.

Animal life is varied and abundant. The tiger, leopard, monkey, many kinds of deer, goat, bear, wolf, rhinoceros, horned sheep, boar, ounce, marmot, flying squirrel, wild cat, and yak are all found. The birds, which include many varieties of pheasant, are numerous, with many of gorgeous plumage. Insects are numerous and troublesome, particularly during the summer rainy season.

A healthy climate prevails in the outer Himalayas, and under the British raj sanatoria and hill stations were established at various places, e.g. at Darjeeling (alt. 8,000 ft.), Simla (alt. 7,000 ft.), long the summer residence of the viceroy, Dalhousie (alt. 7,680 ft.), and Naini Tal (alt. 6,500 ft.).

The prevailing rocks are granite, crystalline gneiss with mica schist, with intrusions of trap. Sedimentary deposits and fossil marine remains have been found at an alt. of over 20,000 ft. The Siwalik Hills may be a later uplift, while parts of the system west of Assam are deemed to have been repeatedly submerged and thrown up again.

The Himalayas are the eastern end of a great series of folded mountains, uplifted in Tertiary times, which terminates in Spain on the W., and forms the backbone of Eurasia. When the ancient continent of Gondwanaland broke up towards the end of the Cretaceous period, great volcanic activity occurred in the Deccan, the sole Asiatic relic of Gondwanaland, and a great crumpling of the earth's crust slowly produced the Himalayas, and upraised the great plateau of Central Asia.

Climbing Himalayan Peaks

Mountaineering in the Himalayas began in 1855 when the brothers Schlagintweit reached 22,329 ft., on a subsidiary peak of Kamet. Sir Joseph Hooker, the botanist, in 1849 climbed in the Sikkim Valley. Pundits of the survey of India (notably Sarat Chandra Das who crossed the Jonsong La, 20,000 ft.), Godwin-Austen, Graham, Conway, Freshfield, and the Bullock Workmans (husband and wife) were among the pioneers.

A. M. Kellas distinguished himself by many climbs in the neighbourhood of Kinchinjunga in the decade before the outbreak of the First Great War. In 1921 he resumed climbing to conquer Narsingh; he died in the first Everest expedition in the same year. His grave is at Kampa Dzong (14,000 ft.). Smythe described Kellas as the greatest pioneer of Himalayan mountaineering from the technical point of view of route-finding and mountaineering.

In the Mt. Everest expedition of 1924, E. F. Norton and T. H. Somervell reached 28,100 ft. In 1931 F. S. Smythe climbed Kamet (25,447 ft.), the first peak of over 25,000 ft. to be surmounted. In 1934 H. W. Tilman and N. E. Odell climbed Nanda Devi (25,660 ft.). Expeditions in which Swiss, Italian, German, American, Polish as well as British climbers have engaged have covered many other regions of the Himalayas. In 1928 the Himalayan Club was founded to encourage Himalayan travel and exploration. Its journal is published annually by the Oxford University Press. See Everest.

Bibliography. Climbing and Exploration in the Karakoram, Sir William Conway, 1894; In the Ice-World of Himalaya, F. B. Workman, 1900; Round Kangchenjunga, D. Freshfield, 1903; Twenty Years in the Himalaya, C. G. Bruce, 1916; Mt. Everest, the Reconnaissance, Howard Bury, 1922; The Fight for Everest 1924, E. F. Norton, 1925; The Kanchenjunga Adventure, F. S. Smythe, 1930; Kamet Conquered, F. S. Smythe, 1932; Everest 1933, Hugh Ruttledge, 1934.

Himeji. Harbour of Honshu, Japan, capital of the prov. of Hyogo. It stands at the junction of three important highways, 34 m. by rly. N.W. of Kobe. The 14th century "Heron Castle" is still in a good state of preservation. The town is important in the coasting and Inland Sea trade. Himeji is noted for its stamped leather work and manufactures cotton goods. Pop. 104,259.

Himera. Greek city of ancient Sicily. It is situated on the N. coast at the mouth of the river of the same name (now called Salso). Here a great Carthaginian army was completely defeated by the Sicilian Greeks under Gelon and Theron in 480 B.C. on the day of the great Greek naval victory over the Persians at Salamis. In 409 the city was destroyed by the Carthaginian general, Hannibal, son of Gisgo.

Himley Hall. Mansion near Dudley, Worcestershire, England, the headquarters of the West Midlands coal board. For many years the home of the earls of Dudley, its history goes back to the 14th century, though the building purchased in 1947 for £45,000 by the coal board was of the 18th cent.

Himmler, HENRICH (1900-1945). German Nazi administrator. The son of an R.C. school-

Heinrich Himmler, Nazi administrator

master, he was born in Munich, Oct. 7, 1900. In 1917 he went to an O.T.C., but saw no active service; after the war he worked as an insurance agent and as a small farmer. He took part in Hitler's *Putsch* in 1923, becoming a fanatical adherent of the doctrine of the German master-race. In 1929 he was appointed leader of the S.S. (Black Guard), which he built up from a personal bodyguard for Hitler to a powerful political weapon; later he formed the Waffen-S.S. as a check on the power of the army. In 1933 Hitler

made him police chief of Bavaria, and in 1936 of the whole of Germany, in which capacity Himmler used the Gestapo and the concentration camps ruthlessly to bring virtually every individual in Germany within his power. He was the moving spirit behind the "blood bath" of June 30, 1934, in which Roehm, Heines, and many others were murdered.

On Aug. 24, 1943, Himmler became minister of the interior, and on July 21, 1944, c.-in.-c. of the home army and supreme controller of the munitions industry. When to these offices he added in Oct., 1944, the command of the Volkssturm, he was supreme in Germany. Henceforth all edicts bore his signature, and he suppressed defeatism mercilessly. When the German armies were beaten he met Count Bernadotte of the Swedish Red Cross at Lübeck, April 24, 1945, in an attempt to induce Great Britain and America to sign a separate peace. Failing in this, he went into hiding, but was arrested by British 2nd army troops at Bremervörde, May 21, 1945, and two days later took poison while being interrogated at Lüneburg, dying the same day.

Himyar (Semitic, red people). Ancient people in S.W. Arabia. Wrestling the S. Arabian hegemony from the Sabaeans about 100 B.C., they established a dynasty under which they influenced for several centuries the Abyssinian kingdom of Aksum, until the Mahomedan conquest. The culture and speech of the sedentary Semites of Yemen, formerly called Himyaritic, is now called generically S. Arabian, and specifically Himyarite, Minaean, and Sabaean.

Hinayana (Skt., little vehicle). The term used by some modern Oriental scholars to denote primitive Buddhism. It serves to distinguish the early doctrinal system, with its arid ethics, agnosticism, and hard asceticism, from the more tolerant Mahayana (great vehicle) of later Indian Buddhism, with its humaner elements, speculative theism, and ritual attractions. Used by some early Sanskrit writers as a term of abuse, it is rarely found in modern India. Its equivalent is sometimes applied, in China and Japan, to elements derived from the earliest missionary teaching, which was based upon the Pali rather than on the Sanskrit texts.

The word is traced back to the Chinese pilgrim Fa-hien, who travelled in the Buddha cradleland early in the 5th century. In that

age a Hinayanist was regarded as a member of one of the primitive schools of Buddhist thought. Of these there were commonly said to be 18, but there were actually more, although three or four only were at any time of wide influence. These schools were not sects but modes of thought, comparable with the broad and high forms of contemporary Anglicanism. They arose between the councils of Vaisali and Pataliputra, 400-250 B.C., and as late as the 7th century A.D. the Chinese pilgrim Yuan Chwang estimated that, of the 200,090 monks then in India, at least two-thirds adhered to the primitive schools. It is on their foundation that the Buddhism of Ceylon, Burma, and Siam arose, although these areas did not remain untouched by Mahayana influences. These, with their worship of Bodhisattvas, or potential Buddhas, and their incorporation of local animistic beliefs, found a sympathetic home in China, Tibet, and Japan. See Buddhism.

Hinchinbrook. Island off the coast of N.E. Queensland, Australia. S. of Rockingham Bay, it is separated from the shore of Cardwell co. by a narrow channel, and its S. point faces the headland of Dungeness. The island contains Mt. Hinchinbrook.

Hinchingbrooke. Village of Hunts, England, just outside the town of Huntingdon. It is famous because here is Hinchingbrooke House, once the residence of the Cromwell family. It was given to the Cromwells after the dissolution of the monasteries, and here one of them built a fine mansion in which Elizabeth and later James I were entertained. They kept the estate until 1627. The house is now the property of the earl of Sandwich, whose eldest son bears the title Viscount Hinchingbrooke.

Hinckley. Market town and urban dist. of Leicestershire, England. It is 14 m. S.W. of Leicester, with a rly. station. The chief building is the restored Gothic church of S. Mary. There is a free library and a grammar school. The chief industries are the manufacture of hosiery, boots and shoes, and bricks. Five m. N. lies the site of the battle of Bosworth (q.v.). Watling Street runs near here, and the place was once a Roman station, many Roman remains having been found near. Market day is Monday. Pop. 37,880.

Hincks, EDWARD (1792-1866). Irish Orientalist. Born at Cork, Ireland, Aug. 19, 1792, he graduated at Trinity College, Dublin,

and became Protestant rector of Killyleagh, co. Down, 1825. He made solid contributions to the decipherment of cuneiform script and Egyptian hieroglyphics. His First and Second Kinds of Persepolitan Writing, which determined the ancient Persian vowel system, appeared in 1846 simultaneously with Rawlinson's solution, achieved independently at Bagdad. He died at Killyleagh, Dec. 3, 1866.

Hindemith, PAUL (b. 1895). A German composer. Born at Hanau, Nov. 16, 1895, he studied at Frankfurt-on-Main under Arnold Mendelssohn. From 1915 to 1923, he first led, then conducted the opera there. A brilliant viola player, he performed with the Amar quartet, and toured Europe for some years.

Hindemith originated the term *Gebrauchsmusik* (utility music) to describe many of his neo-classic compositions, e.g. his opera *Sankta Suzanna* (1922) and orchestral works in the same idiom. His later compositions showed a romantic development. One of the most important composers of his time, his chief works (apart from his operas) included the string quartet *Kammermusik I*, and *Kleine Kammermusik* (for wind quartet), two viola concertos, the Philharmonic concerto, ballet music for *Nobilissima Visione*, and American Requiem. His work was stigmatised as "decadent" by Goebbels, and he became a target of Nazi propaganda. After completing his opera *Mathis der Maler* in 1934, he went to the U.S.A., where he was appointed professor of music at Yale university.

Hindenburg. German airship. The largest aircraft ever constructed when it was launched in March, 1936, the Hindenburg or LZ.129 had a length of 813 ft. and a gas capacity of 6,720,000 cu. ft. It was placed in regular service between Frankfurt and Lakehurst, N.J., the terminus for New York, and on one voyage carried 127 people. On arrival at Lakehurst, May 6, 1937, the airship caught fire and was totally destroyed, with a loss of 36 lives.

Hindenburg. For this town of Silesia placed under Polish administration 1945, see under its Polish name Zabrze.

Hindenburg, PAUL VON BENECKENDORFF UND (1847-1934). German soldier and statesman. Born Oct. 2, 1847, at Posen (Poznan), he was educated at a military college, served as a guards officer in the wars of 1866 and

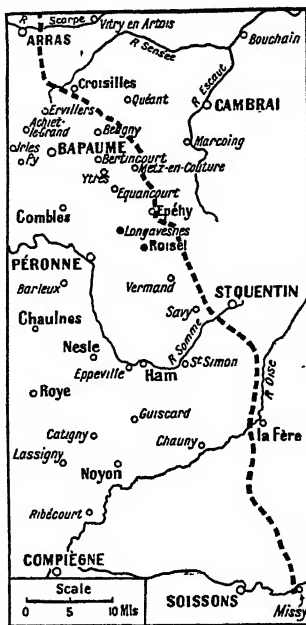

1870-71, rose slowly until he commanded the 4th corps, 1903-11, when he retired. He was recalled to service when the Russians invaded East Prussia in 1914, defeating them at Tannenberg, Aug. 23-30, and the Masurian Lakes, Sept. 5-15. He was made field marshal Nov. 27, and remained German generalissimo in the E. until Aug. 1916, when he succeeded Falkenhayn as chief of the general staff. In fact, Hindenburg was c.-in-c. of the German forces, and with Ludendorff directed the policy of the Reich, being responsible for the U-boat war, the dismissal of Chancellor Bethmann-Hollweg, the Brest-Litovsk peace, and the labour conscription programme, until he sued for an armistice after the collapse of the last German offensives in 1918.

Paul von Hindenburg, German soldier and statesman

Hindenburg remained in command of the German forces in co-operation with the republican government, until July 3, 1919, when he retired once more, wrote his memoirs (*Out of My Life*, 1920), and abstained from politics until in 1925 he agreed to stand for the presidency and was elected. He did not interfere with the process of constitutional government, and in 1932 was re-elected president, his opponents being Hitler and the Communist Thälmann. Despite his personal disdain and dislike for Hitler, Hindenburg was prevailed upon by his entourage to appoint him, January 30, 1933, chancellor of a coalition government, with Papen as vice-chancellor. Senile and ailing, Hindenburg scarcely realized, and was unable to interfere with, the dictatorial regime subsequently set up by brute force. Necessary documents and statements extracted from him by guile included "approval" of the purge of June 30, 1934. He died Aug. 2, 1934, at Neudeck. *Consult* Lives, E. Ludwig, 1935; Gert von Hindenburg, 1935.

Hindenburg Line. German fortified system, built after the 1916 battle of the Somme between Arras and the Chemin des Dames, protecting Cambrai, St. Quentin, La Fère and Laon by lines of trenches strengthened by concrete shelters and gun emplacements. It was used for a sudden

Hindenburg Line. Map showing the extent of the German fortified system built in 1916

withdrawal from advanced positions early in 1917, when the German c.-in-c. undertook his "knock-out blow" against Russia. Its main, southern part, into which the German forces withdrew in mid-March, 1917, after destruction of the whole area west of it, was officially described as the Siegfried line.

Hindhead. Eccles. and residential district, hill, and common of Surrey, England. It is on the Portsmouth Road, 2 m. N.W. of Haslemere. John Tyndall called Hindhead the next best place to the Bel Alp, but Cobbett found it a forbidding place. On Gibbet Hill, 895 ft., was the gallows on which the murderers of an unknown sailor, Sept. 24, 1786, were hanged in chains. Near by is the glen known colloquially as the Devil's Punch Bowl (*q.v.*).

HINDUISM: INDIA'S CHIEF RELIGION

T. WITTON DAVIES, former Prof., University College, Bangor

Further information about the Hindus is given in the article on India. See *Brahmanism*; *Vedas*; also *Devi*; *Sati*, and other *deities*; *Saktas*; *Sivaites*; *Thugs*

Hinduism is a term used for the new Brahmanism which came into being in India after the decline and banishment of Buddhism from that country. Modern Brahmanism, or Hinduism, is a conglomeration of original Brahmanism, of Buddhism, and of elements from other cults, especially those of the aborigines

Excepting Leith Hill, Hindhead and its neighbour, Blackdown, 918 ft., are the highest points of the Greensand ridge, which here abuts upon the Wealden plain. The Wey rises to the S. on Blackdown, circles around Hindhead on the W. and N., and receives 8 small streams which radiate from the plateau; the most notable flows from the Devil's Punch Bowl. The Portsmouth Road runs just below the plateau edge.

Hindi. For this language of India see *Hindustani*.

Hindle Wakes. Play by Stanley Houghton, dealing with life, morals, manners, and character as displayed in a Lancashire cotton town, Hindle, following "wakes" week. First produced at the Gaiety Theatre, Manchester, by Miss Horniman, in 1912, it was seen in London the same year. It has been more than once revived, twice filmed, and frequently broadcast.

Hindley. An urban dist. and parish of Lancashire, England. It is 2½ m. by rly. S.E. of Wigan. The chief industry is cotton manufacture. The council owns the water supply, and the markets. Pop. 21,629.

Hindö. Island off the N.W. coast of Norway. The largest of the Lofoten and Vesteraalen Islands, its area is 863 sq. m. Its coast-line is deeply indented by fjords and is partly wooded. Harstad is the chief of several harbours. Here are hotels, an ancient church, and a Lapp encampment. Lødingen is a fishery station on Vest fjord.

Hindu. General name for the native, non-European inhabitants of India. In a narrower sense, the Hindus are that part of the population of Aryan origin which in prehistoric times migrated from the north-west into the Ganges district, and thence spread over the south. Their chief representatives today are the Brahmans and Rajputs.

(Dravidians, etc.). But two things remain as prominent in Hinduism as in Brahmanism—the supreme position of the Brahman, and the rigid observance of caste.

The Vedas and the Brahmans are still regarded as the ultimate authority in religion, though the former are little read and exercise

Hinduism. Art applied to the representation of gods and goddesses. 1. Lakshmi, goddess of prosperity. 2. Vishnu, one of the principal Hindu deities. 3. Saraswati, goddess of learning. 4. Siva the Destroyer, second of the Hindu deities. 5. Ganesha, god of success. 6. Agni, a guardian deity. 7. Surya the Sun god. 8. Indra, king of heaven

but slight influence upon the religious beliefs and practices of the people. Even the Brahmanas are much less studied and followed than in pre-Buddhistic days. Though the two great Indian epics belong in their original form to the Brahmanic age, they have been so modified and adapted to later times as to become text-books of Hinduism as well as of Brahmanism.

The Vedanta Sutras, or aphor-

isms, belong in their present form to about A.D. 700. The doctrine which they teach is the impersonal pantheism of the Upanishads. This may be regarded as the standard work of Hindu philosophy. The Eighteen Puranas (archaeological treatises) are very much read by the common people, and in particular by women. They repeat the cosmogonies of the two epic romances and give in greater

detail the mythological legends about Siva and especially Vishnu. They have much to say about the worship of these two gods and constitute the principal source and authority for modern Hinduism.

The Tantras (literally threads, then fundamental doctrines) are dependent on the Puranas, as the latter are upon the two great epics. The Tantras are manuals of religion, of magic, of counter-charms, etc., with the addition of hymns in praise of Sakti, the female counterpart of Siva. They are of late date, some no older than the 18th century. They are the product of Sivaism in its most revolting form. There exist an immense number of religious hymns called Stotras which are sung privately, in families, and by large gatherings of Hindus. These have a considerable influence upon the popular mind. The Ramayana of Tulasi Dasa in N. India in praise of Rama, belonging to the 16th century A.D., and the productions of the Tamil poet Tiruvalluva Kurral, are widely read.

Theoretically the gods of the Vedas are those of Hinduism, but in practice Vishnu and Siva and those they represent are the only deities actually worshipped and acknowledged. Indra, the supreme god of the Vedas, receives hardly any notice, and the same is true of Agni, Varuna, Soma, and others. The Hindu Puranas recognize what is called the Trimurti, the three forms, which includes the trinity of gods, Brahma, Vishnu, and Siva. But the first, the shadowy continuation of the Vedic god of that name, is almost ignored in modern Hinduism. For an understanding of the Hinduism of to-day one has to take into account only the other two gods and the gods and goddesses who follow in their train. It is one outstanding feature of Hinduism, especially in its Sivaic section, that it invented a large number of goddesses. Vedism had hardly a place for female deities.

The predominant philosophy in Hinduism is Vedantism as represented in the Vedanta Sutras. Cultured Hindus regard all the deities of modern India, and many of them include the Gods of the Jew, the Christian, and the Moslem, as mere forms and manifestations of the Great All, the One and No Other. Among the Sivaites, however, the dualism of the Sankhya philosophy has considerable vogue.

At least three-fourths of the population of modern India belong ostensibly to one or other of the two great sects, the Vishnuites or the Sivaites. Though a very subordinate god in the Vedas, Vishnu

reaches the highest place among gods in the Puranas. All Vishnuites worship Vishnu or one of his ten or more incarnations. They are strongest in middle India. There are two Vishnuite sects, the Krishnaites, the most numerous though the least intellectual, who regard Krishna, and the Ramaites who regard Rama, as the principal Avatar or Incarnation of Vishnu. The Ramaites are themselves split up into two leading parties: (1) those who hold the "cat-doctrine," as it is called in the sacred books, i.e. believe that God saves a man as a cat takes up its helpless kitten and carries it out of danger; (2) those who support the monkey theory, that in order to be saved a man must lay hold of God as a young monkey does of its mother.

The Sivaites worship as their supreme deity Siva (the propitious one), the modern representative of the Vedic Rudra, the destroyer, except that Siva is regarded as the preserver as well as the destroyer of life. The headquarters of Sivatism are the extreme north and the southern part of India. Siva's symbol is the *linga* (*phallus*), generally accompanied by the *yoni* and often by the figure of an elephant. These were perhaps intended originally to represent the god as the producer of the world, and in the minds of many devout Hindus no other conception is present. Siva's consorts play an important and sinister part in this cult. They are all supposed to be the one consort of Siva, under various names and with correspondingly different attributes: Devi, or the Goddess; Durga, the unapproachable; Kali (*cf.* Calcutta), the black one; Gawri, the bright one; Sati, the faithful one; Parvati, the daughter of the mountain; Bhavair, the terrible one; and Karali, the horrible one.

The principal subdivisions of the Sivaites are the Saktas and the Thugites. The first get their name from Sakti, the female principle. In reality, the Saktas worship Siva on his female side and practise indescribable obscenities as a part of their religion. Their bible is the Tantras. The Thugites profess to worship the female principle under the name Kali. Besides being guilty of the sexual obscenities of the Saktas, they make murder a part of their religion. They have, indeed, a doctrine that no blood should be shed, but parry this by throttling their victims.

1891; Hinduism Past and Present, J. M. Mitchell, 1897; Hinduism and Buddhism, Sir C. Elliot, 1921; Popular Hinduism, L. S. S. O'Malley, 1935; Epics, Myths, and Legends of India, P. Thomas, 1942.

Hindu Kush (anc. *Paropamisus*). Extensive mountain range of Central Asia. It extends from the Pamir mountain knot in a S.W. direction, as far as lat. 34° 30' N. and long. 67° 40' E. The range lies partly in Afghanistan, separating Badakshan on the N. from Kafiristan on the S., and has many peaks exceeding 20,000 ft., the loftiest being the Tirach Mir, 25,000 ft., dominating Chitral. The W. part of the range is not so stupendous as the N. and E., and the snow-line lies at 13,500 ft. It has a length of some 500 m. From Tibet to the Dorah Pass, c. 200 m., the range provides a virtually impregnable frontier for India. The Amu-Daria has its source in these mountains, from which many tributaries of the Kabul river, the Chitral, Panjshir, etc., originate. The valleys of these streams give Kabul its strategic importance. The rocks are mainly granite, gneisses, and schists of various kinds, while sedimentary deposits indicate that the mass was upheaved in late Tertiary times.

Hindus, MAURICE GERSCHON (b. 1891). Russian-born American writer. Born Feb. 27, 1891, he went to the U.S.A. in 1905. He was educated at Colgate university and Harvard. From 1923 he frequently visited the U.S.S.R., and his publications dealt mainly with social and political problems there, e.g. *The Russian Peasant and Revolution*, 1920; *Humanity Uprooted*, 1929; *Moscow Skies*, 1936; *Russia and Japan*, 1942; *The Cossacks*, 1946.

Hindustan OR HINDOSTAN (Pers., land of the Hindus). Name applied to the Indian peninsula, but more correctly to the Gangetic basin, and the country N. of the Vindhya Mts. See India.

Hindustani. Name given by Europeans to an Aryan language which has two forms: Urdu, based on Persian and Arabic, with a Persian script written from right to left; Hindi, based on Sanskrit, with Devanagari script written from left to right. About 150 million people in the Indian sub-continent use this language in one or other of its forms. Urdu is more common in the N. and N.W.; Hindi in and about the Ganges valley. Urdu, meaning the language of the camp, originated in the headquarters of the Great Mogul near Delhi. The Indian govt. decreed in 1949 that in 15 years Hindi (with the Devanagari script) should be the official language of the Indian union. See Devanagari.

Hinge. Device consisting of plates, bars, or flaps pivoted upon pins, on which they turn relatively to each other. In ordinary types there are two flaps. Hinges are usually made of cast iron, wrought iron, steel, or brass.

The following are some of the principal patterns: butt hinges, as used for doors; rising butts, in which the two flaps bear upon each other at an angle where they hinge on the pin, so that a door to which one flap is secured rises as it opens, and its weight upon the tapered seating causes it to close automatically; tee hinge, with one long tapered flap and one short flap; box hinge, with two long tapered flaps of which one is sometimes bent at right angles; and flap bracket hinge, with three flaps and two pins at right angles to each other. One flap is screwed to a support, another to a board, and the third forms a bracket which can be hinged out sideways to support the board when hinged outwards from a wall. There are also the folding screen hinge, by means of which a screen may be folded either way; spherical gate hinge, with one long bar-flap hinging about a pin, but bearing upon a cup filled with grease or

Hinge: various types. 1. Card table. 2. Screw butt. 3. Screen. 4. Rising butt. 5. Wrought tumbler. 6. Piano. 7. Wrought double strap. 8. Backflap. 9. Strap. 10. Wrought cross garnet. 11. Field gate. 12. Scotch tee

oil; and self-closing gate hinge, with a pair of vertical pivots which serve as a bottom hinge for heavy gates. When the gate is closed, both pivots bear in sockets on the gate-post; when opened, all the pressure is sustained on one pivot only, and the bias thus set up causes the gate to close automatically.

Hinkler, HERBERT JOHN LOUIS (1892-1933). Australian airman. Born at Bundaberg, Queensland, Dec. 8, 1892, he was experimenting with gliders in 1911, and served in the R.N.A.S. during the First Great War. In 1928 "Bert" Hinkler achieved the first solo flight in a light aeroplane from England to Australia, taking 15 days. In 1931 he set up a new record by flying in a Puss Moth from New York to London, via Brazil, including a 2,000-mile crossing of the Atlantic. On Jan. 7, 1933, he set out from England for Australia, but was killed when his machine crashed near Arezzo in the Apennines.

Hinnom. Valley of Palestine, S.W. of Jerusalem. It was largely used for burning refuse, and was known as Gehenna. Much of the symbolic language of the Bible about hell has reference to this place. See Hell.

Hinsley, ARTHUR (1865-1943). British cardinal. He was born at Carlton, near Selby, and passed from the college at Ushaw to the English College in Rome, London university, and the Gregorian university. Professor at Ushaw, 1893-97, and headmaster of S. Bede's grammar school, Bradford, 1899-1904, he became pastor of Sutton Park, and then of Sydenham. In 1917 the pope chose him as rector of the English College in Rome and one of his domestic prelates. As bishop of Sebastopolis *in partibus*, Hinsley was dispatched in 1928 to Africa as apostolic visitor, with the task of securing the cooperation of R.C. missionaries in the Colonial office scheme of educational reform. In 1930 he was created titular archbishop of Sardes and apostolic delegate in Africa; but in 1934 ill-health forced him to resign. A canon of S. Peter's, in 1935 he became archbishop of Westminster on the death of Cardinal Bourne, and received the red hat in 1937. He fearlessly

Arthur Hinsley,
British cardinal

denounced tyranny and aggression in Abyssinia, Italy, Germany, and Russia; and in 1940 formed a society called The Sword of the Spirit, a spiritual mobilisation of R.C.s against evil things, especially as exemplified in the totalitarianism of the Axis powers. He died March 17, 1943.

Hinterland (Ger.). A term generally used to denote the land behind coastal belts. It came into general use in England in connexion with the European occupation of parts of the W. African coast. The term is technically used in economic geography for the region or regions which lie behind a port or group of ports through which they ship the bulk of their goods and receive the greater part of their supplies.

Hip-joint. Enarthrodial or ball and socket joint in the body, the ball being the rounded head of the femur, or thigh-bone, and the socket being the cup-shaped hollow, or *acetabulum*, on the outer side of the pelvis. It is a strong joint, surrounded by tough ligaments, and permits of a considerable range of movement of the thigh in every direction.

Dislocation of the hip-joint can sometimes be congenital, i.e. present from birth, and may affect both limbs. The condition is frequently unnoticed until the child begins to walk, when it causes deformity. The defect may sometimes be cured without an operation, the head of the femur being replaced in its socket, and the limb immobilised in plaster of Paris for two or three months. In other cases an operation is necessary. Dislocation of the hip from violence is rare, owing to the strength and security of the joint. The head of the femur may be displaced from its socket either forwards or backwards; reduction is often difficult, and the movements to effect it are complex. After reduction, the legs should be kept tied together for a fortnight, and the patient should not attempt to walk for a month.

The hip-joint is not infrequently the seat of chronic tuberculosis in young children. The child complains of pain in the hip-joint or in

the inner side of the knee, and may be observed to limp. There is slight wasting of the muscles of the thigh, and the affected leg appears a little longer than the sound limb. As the disease progresses, the wasting becomes greater, the pain increases, and the leg appears shortened, owing to the tilting up of the pelvis, producing a marked deformity and limp. Abscess formation is likely to occur, and the pus may burrow through the muscles, and discharge through the skin. In the advanced stage there is erosion of the head of the femur, and real, permanent shortening of the limb. The patient may develop tuberculosis in other parts of the body and die.

If the case is treated early the outlook is hopeful, though there will probably always be some crippling of the limb. In the early stages the joint should be given

complete rest by keeping the child in bed, any deformity being corrected by appropriate splints or by extending the leg by weights attached to a cord carried over a pulley at the end of the bed. When the acute symptoms and pain have abated, the child is allowed to get about on crutches and a Thomas's splint, which should

be worn for six months. Nourishing food and plenty of fresh air are of the greatest importance, and residence in the country or at the seaside is beneficial. In severe cases which are not progressing favourably surgical treatment may be indicated. Other affections of the hip-joint are acute and chronic arthritis (rheumatism), and Charcot's disease, a serious disorganization of the joint which may occur in the course of syphilis. See Dislocation; Tuberculosis.

Hipparchus (fl. c. 146-126 B.C.). A Greek astronomer. Born at Nicaea in Bithynia, he chiefly carried out his observations in the island of Rhodes and in Alexandria. His only extant work is a Commentary on the Phenomena of Eudoxus and Aratus. Hipparchus's title to fame rests upon his catalogue of 1,080 stars, revised by Ptolemy in his *Almagest* (q.v.). He determined the length of the

solar year, discovered the precession of the equinoxes, and calculated the eccentricity of the sun's orbit. He invented trigonometry and the method of fixing terrestrial positions by means of circles of latitude and longitude.

Hipparion (Gr., pony). One of the fossil ancestors of the horse. Remains have been found in Upper Miocene rocks of N. America and the Pliocene deposits of Europe, Asia, and N. Africa. Smaller than our horse, its average height was 4 ft. (12 hands). See Fossils.

Hipper, FRANZ VON (1863-1932). German sailor. Born Sept. 13, 1863, he entered the navy in 1881, and commanded the raid on Scarborough and Hartlepool in 1914. He took part in the battle of the Dogger Bank, and at Jutland, as commander of the cruiser squadron, inflicted serious damage on Beatty's battle cruisers. In Aug., 1918, he was appointed c.-in-c. of the German fleet, but after the mutiny and the surrender to the Allies he went into retirement. One of his country's outstanding naval officers, he died May 25, 1932. His name was later given to a class of German heavy cruisers. A biography by H. von Waldeyer-Hartz, trans. F. A. Holt, appeared in 1933.

Hippias. A Greek sophist, a native of Elis and contemporary of Socrates (5th century B.C.). Famous for his extensive knowledge and remarkable memory, he regarded law as opposed to nature and driving man to act contrary to his natural instincts. He gives his name to two dialogues of Plato.

Hippias and Hipparchus. Sons of Peisistratus, and tyrants of Athens (6th century B.C.). See Harmodius and Aristogiton.

Hippo or **HIPPO REGIUS**. Ancient city of N. Africa, which occupied the site of the present Bône, Algeria. Founded by the Phoenicians, it was the favourite residence of the Numidian kings. Under Rome, Hippo Regius flourished as a trading centre, and became the see of Augustine, who died here in 430. On the advent of Christianity the Roman temples, theatres, and palaces were turned into churches and monasteries. Hippo was sacked by the Vandals and utterly destroyed by the Muslims in the 7th century.

Hippocras. Old English cordial made from spiced wine, sugar, lemon, and other ingredients. The wine, with ginger and cinnamon, was strained through woollen cloths or sieves, known to apothecaries as the sleeves of Hippocrates.

Hippocrates (b. c. 460 B.C.). Greek physician, called the father of medicine. The son of an Asklepiad, a family of priest-physicians practising the cult of Aesculapius, he was born in Cos and studied medicine there; travelled widely, practising in Thrace and possibly in Athens; and is said to have died at a great age in Larissa. He was an acknowledged master in his lifetime, and his oath of service and the Hippocratic ethic established a standard of professional ideals still accepted. He was both physician and surgeon, though in the latter art he was hampered by the Greek objections to dissection. Writings by him or his school include Prognostic; Regimen in Acute Diseases; Epidemics, which contains clinical histories that are models of their kind and were unique for 2,000 years; and The Sacred Disease, a study of epilepsy. A text and translation of Hippocrates, ed. W. H. S. Jones, was published in 4 vols., 1923-31. Pron. Hip-pock-rat-eez.

Hippocrates.
Greek physician
Bust in British Museum

Hippodrome (Gr. *hippos*, horse; *dromos*, running, course). Course for chariot or horse racing in ancient Greece. It was oblong in shape with rounded ends. In modern terminology the word, regardless of etymological associations, has come to be frequently applied to a theatre giving a variety entertainment. See Amphitheatre; Circus.

Hippodrome, THE LONDON. Variety theatre in Cranbourn Street, W.C. Designed by Frank Matcham, it was built in 1899 with special arrangements for converting the stage into a circus arena, or a large water tank. It was opened for spectacular entertainment by H. E. Moss in 1900. Reconstructed in 1909, it became celebrated for its productions of musical comedy and revue.

Hippogriff. Fabulous animal, half horse and half griffin. The name is sometimes applied to a fabulous winged horse.

Hippolytē. In Greek legend, queen of the Amazons. She wore a

famous girdle, the gift of her father Arēs, to obtain which was one of the twelve labours of Hercules. Refusing to give it up, she was slain by him. According to another legend, Hippolytē invaded Attica at the head of her Amazons, but was defeated by Theseus and became his wife. Pron. Hip-polly-tee.

Hippolytus. In Greek legend, son of Theseus. He rejected the advances of his stepmother, Phaedra, who thereupon took her own life, leaving a letter to Theseus in which she accused Hippolytus as the offender. Theseus, in his anger, called upon Poseidon to destroy his son, whereupon the god sent a sea-monster which frightened the horses of Hippolytus, who was thrown and killed. He was restored to life by Aesculapius and afterwards ruled, under the name of Virbius, in the grove of Egeria near Aricia. The tragedy is the subject of Euripides' drama Hippolytus and of Racine's Phèdre. See Phaedra.

Hippolytus, ROMANUS (d. c. A.D. 240). Eccles. writer who is said to have been bishop of the port of Rome. He was pupil of Irenaeus and active in the times of the popes Zephyrinus (202-218) and Callistus (218-223). He wrote in Greek, and is regarded as the author of a work entitled *Philosophoumena*; or, *Refutation of all Heresies*, once attributed to Origen, and aimed especially at the Gnostics. On a marble statue, unearthed at Pontus in 1551, and supposed to represent Hippolytus, was found engraved a list of his works, including the *Philosophoumena*, part of the MS. of which was found at Mount Athos 1842, and published in England 1851. Consult Hippolytus and Callistus, J. J. I. Dollinger, 1853, Eng. trans. 1876.

Hippolytus, CANONS OF. Thirty-eight rules or orders attributed to Hippolytus, bishop of Rome. Existing only in an Arabic translation from a Coptic version of the original Greek, they are valuable for the sidelights they throw on the early life of the Christian Church.

Hippophagy (Gr. *hippos*, horse; *phagein*, to eat). Practice of eating horseflesh. An enormous mass of fossil bones found at Solutré in the Rhône valley supports the view that in Palaeolithic Europe the wild horse was habitually hunted for food before its domestication for riding and traction. The hippophagy of ancient Scythian nomads still survives in central Asia. The practice is also recorded of early Norsemen, and in recent times horseflesh appeared in the

Hippogriff,
fabulous animal

dietary of Danish prisons. In the 8th century Pope Gregory III declared it to be unclean and execrable for human food. The general repugnance of Christendom to this food, like that of Jews to pork, is due in part to considerations rooted in primitive philosophy. During the Terror, in 1793, horseflesh was eaten in Paris, and in Napoleon's retreat from Moscow, in 1812, was made into invalid soup. Some French regiments in the Crimean campaign of 1855 preserved their health by its use.

In 1845 the sale of horseflesh was authorised in Munich, and by 1855 had reached all German states. In 1847 Isidore Geoffroy Saint-Hilaire gave hippophagous banquets in Paris to popularise horseflesh, and in 1866 its sale was regularised in that city. During the siege of Paris in 1870-71, and throughout the First Great War, horseflesh was of great dietetic importance. It is regularly sold in Belgium, and is a primary ingredient in some forms of French sausage.

In 1868 horseflesh was served to 150 guests at the Langham Hotel, London. The Sale of Horseflesh, etc., Regulation Act, 1889, provides a penalty of £20 for supplying it for human food without disclosure, and also for selling, offering, or exposing it except in a place bearing a conspicuous indication that horseflesh is sold there.

Hippopotamus (Gr. *hippopotamos*, river-horse). Large herbivorous mammal of the family

above the surface of the water while nearly all the rest of the head is immersed. Both nostrils and ears can be closed when under water. The thick skin is naked with the exception of bristles on the muzzle, head, and neck, and at the end of the short tail.

The common hippopotamus (*H. amphibius*) is the largest of land mammals except the elephant. It attains a length of 14 ft., and the height at the shoulder is about 4 ft. A fine male will weigh from four to five tons. The skin is blackish brown or slate colour, but white and mottled examples have been seen. Its range is now confined to Central Africa, though it formerly occurred from Lower Egypt to Cape Colony. The Biblical Behemoth is generally identified with it. In the Pleistocene period it occurred in England, being found as far N. as Yorkshire, and it is curious that its remains have been found with those of the reindeer, which is now an Arctic animal.

In habits the hippopotamus is the most aquatic of all the larger land mammals. It sleeps beneath the surface of the water, rising to breathe every four or five minutes, but can remain entirely submerged for ten minutes if pressed by hunters. Slow and clumsy on land, it is a fairly rapid swimmer. It leaves the rivers at night to graze, and in cultivated districts does a vast amount of damage to the crops. It is timid and inoffensive unless cornered, when it becomes a dangerous opponent. It has been known to live in captivity about 30 years, and in a natural state may live much longer.

Economically the hippopotamus is of some value. Its hide is used for making whips and occasionally for walking sticks and umbrella handles, and also for facing ipolishing wheels. The tusks furnish ivory, and were formerly the substance of which artificial teeth

were made. The flesh is excellent eating, and a fine animal will furnish about 200 lb. of useful fat.

The smaller species (*H. liberiensis*) is known as the pigmy hippopotamus, and is found in Liberia, the Guinea Coast, and Sierra Leone. It is black, about 6 ft. long, and weighs about 400 lb. Its head is smaller in proportion than in the common hippopotamus, and there are only two incisors in the lower jaw. Little is

known of its habits, but it appears to feed by day, is never found in companies like the larger species, and is much less aquatic.

Hippuric Acid ($C_9H_9NO_3$). Crystalline substance, contained in the urine of horses and cows. The chemical name is benzamino-acetic acid. On heating with strong acids or alkalis it decomposes into benzoic acid and glycocholl. The crystals are colourless, and easily soluble in hot water.

Hippurites (Gr. *hippos*, horse; *oura*, tail). Group of extinct molluscs found in Cretaceous strata in the Mediterranean area. They are remarkable for one large, usually conical or cup-shaped, shell and a smaller one which served as a cover. Fossil shells often reach three feet in length. They are found in W. and E. Alps, Dalmatia, Greece, and W. Asia.

Hirado or **FRANDO**. Island of Japan, off the N.W. coast of Kyushu. It is 55 m. N.N.W. of Nagasaki and is 19 m. in length and hilly in character. Its chief town, Hirado, a celebrated whaling station, lies on its E. shore. The island has long been celebrated for its blue and white porcelain. It was first visited by the Portuguese in the 16th century, followed by Dutch and English navigators early in the 17th. The Dutch established the first trading station in Japan for the use of foreigners at Hirado in 1610; in 1710 this was transferred to Dejima, a small island near Nagasaki.

Hiram. King of Tyre. Reigning during the time of David and Solomon, he supplied those kings with cedarwood and artificers (2 Sam. 5; 1 Chron. 14). Hiram Abif is traditionally the name of the chief artificer sent to aid Solomon in building the temple.

Hiranyagarbha. Deity of the ancient Hindu pantheon. In the oldest of the Hindu sacred writings, the Rig-Veda, he is represented as the upholder of heaven and earth, and the giver of life and breath. See Hinduism; Rig-Veda.

Hire Purchase. British legal and commercial term. Under a hire purchase agreement the owner of goods lets them on hire at a rent for a period, granting the hirer an option, exercisable at the end of the period, to buy the goods on condition that throughout the period he has paid the rent and observed the other terms of hiring. The agreement is frequently made between the hirer and a finance company which buys the goods from a trader or dealer. Although the sums paid as rent are legally

Hippopotamus. Specimen of the great river hog, an animal indigenous now in Central Africa only
Gambier Bolton, F.Z.S.

Hippopotamidae, related to the *Suidae*, which comprises pigs and peccaries. There are two species, both confined to the tropical region of Africa. The body is bulky and piglike in form, with an exceptionally large head and gaping mouth armed with large tusks and incisor teeth. The lower pair of incisors projects almost straight forward. The nostrils are on the top of the muzzle, and the animal can raise them and its eyes

payments only for the hire of the goods for a period, the agreement is usually so framed that they amount in total to the purchase price of the goods; the final sum paid to exercise the option to buy is usually only nominal in amount.

Special rules under the Hire Purchase Act, 1938, apply to agreements for motor vehicles, and railway vehicles not over £50, for livestock not over £500, and for other goods not over £100. The agreement must be in writing and the cash price of the goods stated.

Any provision in an agreement which authorises the owner of the goods to seize them by force is illegal. In every agreement it is implied, except with second-hand articles, that the goods are of merchantable quality. When one-third of the hire purchase price has been paid, the owner can recover on default only by court proceedings. The court may order part only of the goods to be returned to the owner. This Act applies only to England. Special provisions for Scotland are contained in the Hire Purchase and Small Debt (Scotland) Act, 1932.

Hirohito (b. 1901). Emperor of Japan. Born April 29, 1901, at Tokyo, son of the emperor Yoshi-

Hirohito,
Emperor of Japan

hito, he entered the peers' school in 1909 and two years later was commissioned sub-lieutenant in the army and navy. In 1921 he visited Europe, the first Japanese crown prince to do so. On his return he became regent for his father. In 1924 he married Princess Nagako Kuni (b. March 6, 1903) and on Dec. 25, 1926, ascended the imperial throne. His reign was called Showa, or light and peace, and he furthered the westernising of his country, where manhood suffrage had been granted in 1925.

Although Hirohito's share in Japanese aggression was denied on the plea that he was above politics, he did approve the various acts of aggression from the seizure of Manchuria to the attack on Pearl Harbour. Early in the Second Great War he remained in semi-seclusion, but towards its close he issued an imperial rescript admitting that the situation was truly grave. Following the Japanese surrender, the emperor was permitted to retain his throne. On

Hiroshima, Japan. The main street of this once important city, seen two years after its destruction by an atomic bomb, Aug. 6, 1945. See also Atomic Bomb illustration.

Sept. 27, 1945, he broke with imperial precedent by personally visiting Gen. MacArthur, Allied c.-in-c. At a press interview he denounced war as an instrument of policy and blamed a former premier for Japanese aggression. He declared that in future the country would be governed constitutionally, and after MacArthur had decreed the abolition of Shintoism (*q.v.*) as a state religion, Hirohito on Dec. 31, 1945, declared false the conception that the Japanese emperor is divine and his people destined by their superiority to rule the world. See Japan.

Hirosaki. City of Honshu, Japan, in the province of Mutsu. It stands on the Tsugaru plain near a range of hills, 20 m. by rly. S.S.W. of Aomori. It has castle ruins and a museum. On the W. of the town is the solitary cone of Iwakisan, 4,650 ft., which forms a prominent landmark. Hirosaki is noted for its apples and silk, and the inhabitants are expert in the manufacture of fine lacquer ware. An important and picturesque town, it is the headquarters of a high court. Pop. 51,500.

Hiroshige, ANDO TOKITARO (1797-1858). Japanese painter. He studied under Riansai Okajima and Toyoturo Ontagawa, and established a school of art. He died at Yeddo, Oct. 12, 1858. His somewhat rare paintings and many colour prints from wood blocks of Japanese landscape are of high artistic value. The Melbourne Gallery, Australia, possesses a snow scene by him.

Hiroshima. City of Honshu, Japan, in the prefecture of Hiroshima. The former city lay pictur-

esquely at the head of a bay, on the S. coast of the island, 190 m. W. by S. of Kobe, on the rly. between that city and Shimonoseki. Facing the site is the sacred islet of Itsukushima, famous for its beautiful Shinto temple, a resort of thousands of pilgrims to whom the island is known as the Island of Light.

In the city itself there were many temples and shrines, a recreation ground, and numerous tea-houses. Commercially important, Hiroshima carried on a brisk trade in lacquered ware, bronze goods, and objects of art; it was the largest depot for the surrounding district on the Inland Sea. Ujina, 4 m. away, was a busy port for steamers in the Inland Sea and Formosa trade, and after 1894 a transport base in time of war. Hills rise 700-800 ft. to the immediate N.W. and N.E. of Hiroshima, but the city itself stretched over the flat ground of shores and islands of the delta in all directions for roughly 2 m. from the centre. The latter contained reinforced concrete office and commercial buildings. Farther out lay a densely populated industrial zone of wooden workshops and dwellings, developed during the early 20th century. On the S. and W. outskirts were engineering plants.

At 8 a.m. on Aug. 6, 1945, the first atomic bomb to be used in warfare was released over Hiroshima by a Superfortress of the U.S.A.A.F. flying at 30,000 ft. The bomb exploded 1,000 ft. above the city centre, and the flash of the explosion was observed by a reconnaissance aircraft 170 m. away. Hiroshima had been practi-

cally undamaged by air attack before this, but widespread devastation was caused by the single bomb. Blast spread destruction with great uniformity in all directions. Innumerable fires burned for days, completely gutting the old town and the industrial zone enclosing it. Modern industrial buildings some $1\frac{1}{2}$ m. from the centre of the explosion survived.

The scale of the disaster brought civil and industrial life to a standstill. There was a panic flight in which officials and civil defence personnel joined; even the rescue and fire services were abandoned. Clearance of debris and disposal of the dead did not begin for nearly a month. Water and gas services were completely destroyed; all communications, both internal and external, were disrupted. Of 49 bridges within 2 m. of the city centre, eleven were destroyed and the remainder damaged. All vegetation was wiped out over 100,000 sq. yds. Of Hiroshima's pop. of 343,000, 78,150 were found dead and 58,839 injured; many of those injured died later from the effects of gamma rays released by the atomic fission of the bomb. Some 95 p.c. of the people within a quarter of a mile of the explosion were killed outright, and 50 p.c. exposed to radiation at a distance of a mile eventually died. In addition, thousands who sought refuge on Ninoshima, a small island in Hiroshima Bay, died there, their bodies being found two years later during a survey to select a site for the burial of Hiroshima's dead.

By 1947 life had begun again in temporary buildings. In 1949 plans were passed for developing Hiroshima as a "peace memorial" city. See Atomic Bomb; consult Hiroshima, J. Hersey, 1946.

Hirsch, MAURICE, BARON DE (1831-96). Jewish financier and philanthropist. He was born at Munich, Dec. 9, 1831, his father and grandfather having been bankers to the Bavarian court. Having made an enormous fortune by obtaining concessions from the Ottoman government for the construction of the Balkan railways, he became an Austrian subject, and bought a magnificent estate at Ogyalla in Hungary. He took an active interest in the turf, his filly La Flèche winning the Oaks, the St. Leger, and the 1,000 Guineas in 1892. He contributed more than £2,000,000 to a society for settling Russian Jews in Argentina and Canada, and did much in other ways to help distressed members of his race. He died April 21, 1896.

Hirschberg. Town of Lower Silesia. The historical centre of Germany's textile industry, especially veil making, and later of a linen industry, it came into Polish hands after the Second Great War. On the Bober, Hirschberg is a rly. junction between Breslau and Görlitz, 30 m. S.W. of Liegnitz. It has three old churches, a town hall (1747), several towers, gabled houses in Baroque style, and famous arcades. It is a centre for touring the Riesen Gebirge. Besides textiles, paper, iron, and glass industries flourished before 1939. Pop. 31,407. Another Hirschberg, on the Saale in Thuringia, 14 m. W.S.W. of Plauen, is known for a 17th century castle and its National park reserve.

Hirschfeld, GEORG (b. 1873). German novelist. Born in Berlin, Nov. 11, 1873, he came under the influence of Gerhart Hauptmann, and at 20 began to write. In 1895 he produced *Dämon Kleist*, followed by several plays, of which *Die Mütter* and *Agnes Jordan* had successful runs. His best known works were *Freundschaft*, 1902; *Das grüne Band*, 1905; *Das Mädchen von Lille*, 1907; *Onkel und Tante Vantee*, 1913; and a biography of Byron, 1926.

Hirschsprung's Disease. A complaint called after the surgeon who first described it. This is a congenital dilatation of the colon due to non-functioning of the neuro-muscular mechanism of the bowel. Treatment consists of stimulation of the gut wall by strychnine, massage, and electricity, and dieting.

Hirst, HUGO HIRST, 1ST BARON (1863-1943). British industrialist. Of Jewish origin, Hirst was born in Munich, Nov. 26, 1863, the son of Emmanuel Hirsch; he emigrated to England in 1881, changing his name two years later. In 1889 he founded the firm which later became the General Electric co., and with its growth became wealthy and influential. He was a member of the board of trade advisory council, 1923-25, and committee on unemployment insurance, 1925-26, and at various times was president of the F.B.I., the Institute of Fuel, and the British Electrical Development Society. He became a baronet in 1925 and a baron in 1934. In 1942 he gave £20,000 to the benevolent fund of the Inst. of Electrical Engineers, to be known as the Hirst Fund. He died Jan. 22, 1943.

Hirst, GEORGE HERBERT (b. 1871). English cricketer. Born Sept. 7, 1871, at Kirkheaton, he

became a regular member of the Yorkshire eleven in 1892, and played for England against Australia 1897-1909. He was a fine batsman and a fast-medium left-hand bowler, with a most deceptive swerve. His best batting year was 1904, when he scored 2,501 runs with an average of 54.36, and his best bowling year was 1906, when he took 208 wickets for an average of 16.5. In 1906 also, with 2,385 runs, he set up a unique record—2,000 runs and 200 wickets; he scored 1,000 runs and took 100 wickets in 14 seasons. He appeared in a county match in 1929, forty years after his first. In 1920 he became cricket coach at Eton.

Hirtius, AULUS (d. 43 B.C.). One of the lieutenants of Julius Caesar in Gaul. The authorship of an eighth book on the Gallic War and of a history of Caesar's Alexandrian war is generally attributed to him. In 43 he and Pansa, his colleague in the consulship, were sent to relieve Mutina (Modena), then besieged by Antony. The latter was defeated, but both consuls lost their lives.

His Majesty's Theatre. London theatre, in the Haymarket (q.v.). In the first building erected on the site, opened as the Queen's Opera House in 1705, the first performance of Handel's *Rinaldo* took place in 1711. The building having been burnt down, a new one was erected in 1791, and named the King's Theatre. Here Don Giovanni was produced for the first time in England in 1817. On the accession of Victoria the name of Her Majesty's Theatre was given to the building, which regained popularity in 1847 with the début of Jenny Lind.

The days of Tietjens, Trebelli, and Nilsson followed from 1862 to 1867, when the theatre was burnt

His Majesty's Theatre, Haymarket, London, built in 1897

to the ground. Rebuilt, it stood empty till Moody and Sankey filled it with their Revivalist services. The present theatre, built of Portland stone and red granite, was designed by C. J. Phipps in 1897 for Beerbohm Tree, with whom it was long associated. On the accession of Edward VII its title was changed to His Majesty's Theatre. Here Chu Chin Chow set up the British record of 2,238 performances, 1916-21.

Hispano Gun. Light A.A. gun first produced by the Hispano-Suiza motor company and later adopted by the British and other governments. A recoil-gas-operated gun, very light and mobile, it fires 16 types of 20-mm. ammunition. The gun can be fed by a drum magazine containing 30 rounds or a belt holding 100 rounds. Rate of fire is 600 rounds per min. and effective range 6,000 ft. During the Second Great War, Hispanos were mounted in each wing of most British fighter aircraft. See also Orlikon Gun.

Hisspar. Pass and glacier in the Karakoram Mts., Central Asia, N. of Balistan, Little Tibet. It reaches an alt. of 17,650 ft.

Hiss, ALGER. See Hiss Case, in N.V.

Hissar. District, subdivision, and town of India. In the Ambala division, E. Punjab, its area is 5,213 sq. m., about four-fifths of which is under cultivation, the chief crops being millet, barley, and wheat. The rainfall is about 15 ins. Irrigation from the Sirhind and Western Jumna canals enables some crops to be grown, but the harvest is uncertain. The district contains cotton ginning and pressing factories. Hissar town is a rly. junction but of little commercial importance. Pop., dist., 1,006,709; subdivision, 239,857; town, 31,000.

Hissar. A town in the Tadzhik S.S.R., Asiatic Russia. The ancient capital of a once independent region, it was famous for knives, damascene swords, and silk. The country is fertile, producing grain, cotton, flax, and rice; but the climate is hot, damp, and unhealthy, and the town has declined to little more than a few streets of thatched huts. The nearest rly. is at Stalinabad, 20 m. N.

Histamine. Bodily substance chemically described as β -iminozyl-ethylamine, a base derived from the amino-acid histidine by the loss of carbon dioxide. Produced in cells at a seat of injury, it is believed to be an agent of shock conditions, causing contraction of plain muscle and dilatation of the capillaries. It is the

immediate cause of allergic maladies, migraine, hay fever, nettle-rash, etc., and is sometimes given by injection in treatment of vasomotor disturbance.

Histology. (Gr. *histos*, web, tissue). Branch of biology dealing with the microscopical structure of the tissues of organisms, especially of animals. The tissues of both plants and animals consist of cells, and structures derived from them; histology concerns itself primarily with these tissue elements and the ways in which they occur together.

The study of cells generally began with the discovery of blood corpuscles by Malpighi (1628-94); that of plant cells was initiated by Robert Hooke (1667). François Bichat (*q.v.*), the French physiologist, laid the foundations of animal histology in his great work, *Anatomie Générale Appliquée à la Physiologie et à la Médecine* (1801-12), in which he showed the intimate connexion between the heart, brain, and lungs, and classified tissues according to their structure. Hugo von Mohl, Schleiden, and Schwann made further progress in the science of histology by their studies of the cellular structure of plants, the last two showing that animal and plant tissues all develop from cells.

The cells of embryos of plants and animals, together with most other cells which multiply rapidly, have much in common. They consist of relatively dense, uninucleate protoplasts tending to be spherical but rendered polyhedral by mutual pressure. Marked differences become apparent, however, both between the tissue elements of plants and animals, and among the various kinds of tissue elements of any one organism, as the growing tissues mature. One outstanding difference between plant and animal tissue elements generally is the preponderance of sap over protoplast in the former and the reverse in the latter; another is the tendency in plants for the formation of massive cell walls, not usually found in animal tissues where, except in such instances as bone, the adjacent protoplasts lie close together. On this account the limits of the elements in plant tissues are readily visible, while those in animals are less strongly defined. Hence plant histology stresses the construction and constitution of the wall of the individual element, while animal histology deals chiefly with the forms of the protoplasts and their aggregation into tissues.

Among the commonest tissue elements found in plants are parenchyma cells, approximately isodiametric with a large vacuole enveloped in a thin layer of cytoplasm within the wall, which may be chiefly cellulose or may contain in addition a quantity of lignin to make it lignified (woody); collenchyma cells, more or less cylindrical with unequally thickened walls, usually of cellulose, containing protoplasts; sclerenchyma fibres, elongated elements with tapering ends, having considerably thickened walls which are usually lignified but within which the protoplasts have degenerated; sieve tubes, tubular elements with cellulose walls lined with cytoplasm which are derived from rows of cells whose cavities have become confluent by the formation of pores in the walls between them, each perforated wall being a sieve plate; xylem vessels, tubular elements with lignification in their walls but without protoplasts when mature, derived from a row of cells by the extensive dissolution of the intervening walls.

The last two kinds of element normally occur with others in the phloem and xylem tissues respectively, so forming complex tissues in contrast to simple tissues which are constituted of parenchyma cells, collenchyma cells, or sclerenchyma fibres alone.

Varieties of Animal Tissue

Of the simpler animal tissues, epithelia consist of one or a few layers of close fitting cells resting on a basement membrane to form the external surfaces of animals or the linings to cavities of the body, which communicate with the exterior; according to the shape of the individual cell, when the tissue is single layered, it is called pavement, cubical, columnar, or ciliated epithelium; if cells are superposed in layers the epithelium is stratified. In connective tissue the cells are embedded in copious ground substance so as to appear widely separated by it; this matrix is a uniform glistening material in hyaline cartilage, but contains fine elastic fibres in elastic cartilage; it is infiltrated with calcium salts in bone. Blood consists of a fluid—the plasma—in which are suspended red blood-cells (erythrocytes), white blood-cells (leucocytes), and platelets. Voluntary muscles (those under the control of the will) are principally formed of striated muscle fibres, so called because they exhibit alternate dark and light bands across their length; involuntary muscle fibres

do not show this striation. Nerve tissues are made up of cells from which filamentous outgrowths project; the main body of the cell is the cyton, long outgrowths are axons, short ones dendrons.

Schäfer, 1910; Practical Histology, J. N. Langley, 1920; Introduction to Plant Anatomy, Eames and MacDaniels, 1925; Structure of Economic Plants, H. E. Hayward, 1938; Textbook of Histology, P. Stoehr, 1944; The Tissues of the Body, W. E. le Gros, 1945; Practical Plant Anatomy, C. J. A. Berkeley, 1947.

Historical Manuscripts Commission. In the U.K., a royal commission appointed in 1889 to examine and report upon the historical records (other than the public records), manuscripts, etc., in existence in the country. It is a permanent body, the chairman being the master of the rolls, and has published detailed reports on various valuable collections of historical material, e.g. those at Hatfield and Longleat. Since 1945 it has been compiling a register of archives. See Public Record Office; State Papers.

Historical Method. Term used mainly in economics for a method of inquiry that bases its results upon the facts of historical research rather than upon theories.

HISTORY: THE STUDY OF THE PAST

A. D. Innes, M.A., Author of *A History of the British Nation*

This article describes the main principles which underlie the study of history, on which subject there are hundreds of articles in this Encyclopedia. These articles include histories of all the nations of the world, both past and present, sketches of Feudalism, the Reformation, and other intellectual and economic movements, and biographies of kings, soldiers, and statesmen; also historians

History is concerned with the inception, progress, or decay of organized communities, the movements, the events, and the personalities connected therewith. In the literary sense of the term, it is the written or pictured record of that process of development. In the scientific sense it is the accumulation and investigation of the data provided by the past for the science of politics, with which every citizen is vitally concerned in a country where every citizen has a share, however small, in controlling the government of the state, a periodical duty of pronouncing his own judgement upon political questions, and a definite responsibility towards the state of which he is a member. History is the gathered experience of the past in relation to

It is the inductive as opposed to the deductive method. More narrowly it is applied to those German scholars who follow the system founded by W. Roscher. See Logic; Roscher.

Historical Society, ROYAL. British learned society founded in 1868. Its objects are the promotion of historical study and research. Papers are read at its monthly meetings, and its transactions are published annually. Fellows are styled F.R.Hist.S. The offices are at 96, Cheyne Walk, London, S.W.10.

Historiographer (Gr. *historia*, history; *graphein*, to write). Official historian. Soon after the revival of learning certain rulers and princes began to appoint scholars to write the histories of themselves and their lands. The emperor Charles V, Louis XIV, and other kings of France, for instance, had their historiographers royal, who included Racine and Voltaire, while Charles II of England appointed one on his Restoration. Obviously the work of these men, who had to write something laudatory, had little value. The most interesting of these survivals is the king's historiographer in Scotland. The office existed there before 1603, but fell into abeyance. In 1763 it was revived, William Robertson being appointed. His successors included the historians J. H. Burton and W. F. Skene.

imagination of the student. It is improbable that any historians, however learned, will ever succeed in displacing the conceptions of historical figures created by the plays of Shakespeare, or the novels of Walter Scott and others, in spite of the knowledge that such works made no profession of historical accuracy; and while nine educated persons out of ten are aware that Macaulay, Carlyle, and Froude are denounced as misleading, the majority will prove in effect to be their more or less unconscious disciples.

The study of history provides us with actual precedents, and the data for principles to be applied to present-day problems, though it is necessary to bear in mind the paradox that, although "history repeats itself" perpetually, it may be said with equal truth that it never repeats itself. The events of the past manifestly have a bearing upon the present, but there is always a danger of forgetting that the nature of a problem may be entirely changed by quite unobtrusive variations in circumstances.

To the youthful mind the practical problems of citizenship, most of the political side of history, are not easily made intelligible and interesting, but youth is susceptible to the inspiration of high enthusiasms, noble ideals, chivalrous sympathies, heroic deeds. For the formation of character, nothing is more essential than to foster such susceptibilities, to train the mind of the child to admire rightly noble men, noble women, and noble deeds, to hate foul deeds and their doers. And therewith it is essential to instil the sense of justice. To this end history rightly handled is an incomparable medium. Every boy or girl is the better for learning to conceive an enthusiastic admiration for Leonidas, Regulus, Robert Bruce, Joan of Arc, or Sir Philip Sidney; the better for learning to be just to Cromwell or Edward I. When the study of history becomes a search for unprejudiced historic truth, there is no finer moral training.

History in the literary sense came actually into being when men began to concern themselves not merely with recording contemporary events, but also with comparing and coordinating, however uncritically, such records as had survived from the past, whether graven, or written, or through oral tradition. The earliest historical literature we possess is that of the Hebrew Scriptures, and it is at least tolerably certain that, in the

social and political organization, and so for all responsible citizens it is a study of serious practical importance.

The functions of the historian are threefold: to ascertain and accumulate facts; to coordinate and relate them in true perspective; and to indicate and test the generalisations which may be inferred; to which may be added the fourth function, that of artistic presentation. For the ordinary citizen cannot himself be a historian; it is from the historians' researches that he must derive his knowledge of history; and it is absolutely certain that the historians from whom he will derive it will be those who present it in a manner which appeals effectively to the

form in which we have them, they are derived in part from documents which must have been in existence some fifteen hundred years before the Christian era. In this sense they are the earliest consecutive narrative consciously constructed as a story of the development of an organized community. The things elsewhere written or depicted at an earlier date were either symbolical or were presentations of contemporary episodes, or were not made with the intention of recording events, though of great value to students endeavouring to reconstruct the past. Such were the legal code of Hammurabi, king of Babylon, the Amraphel of whom we read in the book of Genesis as the contemporary of Abraham, diplomatic correspondence like the Tell el-Amarna Letters, discovered in Egypt in 1888, and various other documents and monuments.

In the 7th and 6th centuries, Bablyonia and Assyria began to produce official annalists. In Egypt, too, the priestly caste had preserved historical records from which a scanty information was presently to be derived by lay inquirers. In the remote East, the Chinese, a very advanced people, compiled their own records, as also did the Aryan invaders of India. But it was in the 5th century B.C., when Greek literature burst into full blossom, that history permanently established itself as a branch of literary art and of political science. Apart from the Hebrew chronicles, the world before the 5th century provided materials for historical investigation, but it did not provide historians.

The historian first reveals himself in literature as the child of the epic poet. He is a man with a great story to tell, a drama vivid with human life, only his medium is not verse but prose; and, whereas to the poet it is a matter of indifference whether things actually happened as he relates them, whether his story is fact or fiction, or blend of fact with fiction, the historian intends his story to be one of actual fact duly verified. As with the epic poet, his work must be on the heroic side, but his characters are real, not imaginary kings, captains and statesmen, leaders of men.

The Father of History

So it was with the Hebrew chroniclers; so it was with the Greek Herodotus, who is called "the Father of history," who told the immortal story of the mighty contest wherein Greece in the days of her glory did battle for the cause of freedom and rolled back the flood of Orientalism. Incidentally

he collected and set forth much information, not without a legendary element, concerning the rise of the Persian empire and the antiquities of Egypt. A generation later the scientific element was introduced by Thucydides, who chose for his theme contemporary history—the struggle for supremacy between the two leading states of the Hellenic world, wherein he himself played a minor part. It might be said that Herodotus and Thucydides, two of the greatest among all literary artists, set between them the models which have been followed by all the great literary historians, from Livy and Tacitus through Froissart to Hume and Gibbon, Macaulay, Carlyle, and Mommsen. The extraordinary merits of Thucydides have given to his subject, the contest between Athens and Sparta, a historical prominence out of proportion to its intrinsic importance, by reason of the masterly treatment it received, which enhances its interest to the student of political science.

From the time of Thucydides onwards there was among the Greeks no lack of historians, though none can be named as of the first rank; their work is for the most part valuable only so far as it relates to contemporary events. They provide the modern inquirer with little more than outlines to be filled in from other sources, such as the recorded speeches of political orators or the discussions of political theory by philosophers.

The Roman Era

Historical writing again comes to the forefront in the great literary era of Rome, which begins in the days of Julius Caesar and ends some century and a half after his death. Caesar himself appears as a historian in the record of his campaigns in Gaul. Livy, in a brilliant narrative, relates all that either traditions or authoritative records have to tell of Rome's past. Tacitus gives a masterly though extremely biased picture of political conditions, persons, and events at the moment when Republican Rome had transformed itself into Imperial Rome. And still the modern investigator finds even more guidance in the works of men of letters who were not professed historians, in the satires of the poets, and in the semi-philosophical discourses, the public orations, and the private epistles of Cicero, while the art of historical portraiture was perfected by the pen of Plutarch.

The age of the Antonines, great in many ways, was unproductive. An intellectual stupor took possession of the Roman Empire; in the west

it was overwhelmed by the barbarian flood, against which in the east it maintained only a precarious existence. The records of the early Middle Ages were compiled mainly in the extremely uncritical and secluded atmosphere of the cloister. Though literature was smothered in the outer turmoil, in the cloister records were preserved, such as the Anglo-Saxon Chronicle. Apart from the official chroniclers of contemporary events, although so-called histories were written, little serious attempt was made to distinguish between fact and fiction; picturesque legend absolutely incredible was allowed to pass for history at least as concerned the past. But in the 13th century a new literary era was dawning; in the 14th it had dawned. The art of writing contemporary history revived with Froissart, though to him it was still only the painting of its gorgeous pageantry.

Froissart and Raleigh

With the sixteenth century, the revival of letters, already active in Italy for two centuries, but only sporadic elsewhere, expanded all over western Europe at the moment when letters had been finally extirpated in the east. Thenceforth the recording of contemporary history became general; later medieval history was treated in the spirit of Froissart, and what may be called the authorised histories of Greece and Rome were studied as a necessary part of polite culture, the outcome of the discovery of the classical literature of Rome and Greece. At the same time history again began to be treated as a branch of political science, the Florentine Machiavelli leading the way.

From the beginning of the sixteenth century, then, there is an abundance of literary records ready to the hand of the modern inquirer. Through the Tudor period vigorous and picturesque narrative is characteristic of the English and Scottish writers, whether they are dealing trenchantly with the story of the Reformation, like John Knox, or Foxe in the Book of Martyrs, or telling the sagas of the Elizabethan seamen, as in Hakluyt's Voyages and the soul-stirring narratives of Sir Walter Raleigh. Raleigh travelled into a still more remote past; for when he lay a prisoner in the Tower he set about writing a History of the World, which Oliver Cromwell ranked next to his Bible. We do not now read Raleigh's History of the World, any more than we use Elizabethan maps for the study of geography. Its value as conveying a knowledge of

the past is nil. But in this particular book the value lies not so much in the narrative as in the commentary of one of the most brilliant intellects of the most brilliant epoch of English literature. Of another type altogether in the historical field were the researches of John Stowe, who unearthed the works of those medieval chroniclers who provide us with the real groundwork of our knowledge of the Plantagenet era—Matthew Paris, Thomas of Walsingham, the so-called Matthew of Westminster, and others.

Invaluable Private Memoirs

The 17th century begins to provide us with what grew into an increasing stream of literary works which are not in form histories but memoirs invaluable to the historian, of which an admirable example is Lucy Hutchinson's *Life of her husband, the Puritan colonel, together with the immortal diaries of Samuel Pepys and John Evelyn*, none of them works written for publication. But it gives us also two great works of contemporary historians. The *History of the Great Rebellion*, by Lord Clarendon, and *The History of My Own Time*, by Gilbert Burnet, who was also the author of a *History of the Reformation in England*. Clarendon's work at least remains a literary classic. Everywhere, however, the historians continued to devote themselves entirely to the modern era until the 18th century was far advanced, whilst in France Saint-Simon was writing the incomparable *Memoirs*, which were not published till the 19th century, and Voltaire was producing his brilliant pictures of Charles XII and Peter the Great, and of the Ages of Louis XIV and Louis XV, more with an eye to literary effect than to the pursuit of exact historic truth.

But with the second half of the 18th century a reaction was setting in against the convention in France which may be said to have recognized only two eras as of real importance in the history of the world—the Augustan Age of Rome and the Bourbon Age of Europe. From Scotland, Hume produced the first great *History of England*, and Robertson the first great *History of Scotland*; and in his Charles V Robertson gave something like an appreciation of the Middle Ages.

Already in France Montesquieu, not writing history in the technical sense, had developed the principle of examining political institutions in the light of the history of their growth and development, and their

relation to institutions in other countries and other ages; and Burke, as a statesman, was insisting upon a corresponding theme. Then came again from Britain two monumental works, both in 1776: Adam Smith's *The Wealth of Nations*, which developed the relation between the scientific studies of history and of economics, and the work which is perhaps the greatest of all histories, Gibbon's *Decline and Fall of the Roman Empire*.

This, at least, is to be said of Gibbon, that, like Thucydides, he can never be superseded; all other work covering the ground will be in the nature of a commentary on Gibbon, however much those particular commentaries may compel us to revise particular judgements of the great man, or newly coordinated data may correct misapprehensions of fact which it was impossible for him to avoid. And his achievement was the more tremendous because, unlike Thucydides, he wrote not of what he had seen and heard with his own eyes and ears in one small corner of the world during a single lifetime, but of the long-past history of half the civilized world during a thousand years. Gibbon, in fact, gave a new meaning to the name of historian; and his work was hardly finished when the cataclysm of the French Revolution and the wars which followed upon it gave a new impetus to history.

Renewed Study of Ancient History

The 19th century witnessed first the further revival of that interest in the past the beginnings of which we have noted as preceding the revolution, the interest especially in medievalism which is associated with the whole movement known as romanticism. Next, the labours of Niebuhr gave a new vitality to the story of Ancient Rome—one which is of the most profound interest to the British race, the creators of an empire to which none save that of Rome offers an approximate analogy. On the renewed study of Roman history as a subject of vivid living interest followed a like revival of the study of the states of ancient Greece; and from the study of Greece the new spirit of inquiry extended itself to the yet more ancient empires of the East, the excavation and interpretation of ancient monuments which at last began to reveal the secrets that had been hidden for more than 3,000 years. Nor did the movement end here, but carried itself into investigations of primitive

social conditions—so primitive that when they existed no conscious records of them were made. History, in short, in one of its aspects—archaeology—became a reconstruction of the only half-realized structures of the remote past, and also a detailed examination of origins. It was no longer a picturing of the full-grown plant in full leaf, but an inquiry into its organic life.

The literature of the 19th century is crowded with the names of brilliant exponents, from those who have taken all historical knowledge to be their province, such as Buckle, whose work on *The History of Civilization* was merely conceived as an introduction to the subject, to men whose real work was concentrated upon a particular period, such as Macaulay or Froude.

Macaulay's Method of Presentation

Macaulay made it definitely his business to write history in such a manner that its interest might appeal with no less attraction than pure, unqualified fiction to ordinary men and women. He did so by making it a picture of a live world full of live people, generally either very good or very wicked. Incidentally, he was among the first to make his presentation of history a medium for teaching his own political doctrines, not without much collecting and sifting of evidence, but with a firm conviction that such evidence as told against his preconceptions came from tainted sources, while anything that told in favour of them required no further guarantee for its veracity. Much the same might be said of Froude. Of a different school were Hallam and James Mill, who rejected the attitude of palpable advocacy which Froude and Macaulay made no attempt to conceal, and assumed an air of rigid philosophic impartiality which veiled an equally firm determination to impose their own predilections upon their readers. An artist of a different type was J. R. Green, who was concerned with the atmosphere rather than the drama of history, with the landscape, the setting, more than with the portraits.

On the other hand, the theory of history which treats it as pivoting upon great personalities, the old principle of portraiture, found the mightiest of all its exponents in Thomas Carlyle. The doctrine which he practised with tremendous effect, not only in his *History of Frederick the Great* and *The Letters and Speeches of Oliver Cromwell*, but also in *The French*

Revolution, is most explicitly set forth in *Heroes and Hero-Worship*. In effect, its essential premise is that what is of significance in the history of the world is the history of its great men, its heroes.

Carlyle's hero theory found many followers; but before the 19th century was out revolt against it came from various schools of writers. One school, for instance, saw history as a struggle between nations for economic advantage; another, inspired by Marx, saw it as a prolonged class struggle; a third sought, by careful study of all existing evidence, to reconstruct an unbiased picture of the lives of the common people in terms of the period described. In this last group an outstanding figure was G. M. Trevelyan.

New schools will doubtless continue to arise. None of them can present the whole truth, though each in turn, old and new alike, shows a facet—sometimes large, sometimes small—of the truth.

Bibliography. Lecture on the Study of History, Lord Acton, 1895; *History and Historians of the Nineteenth Century*, G. P. Gooch, 1913; *History and the Reader*, G. M. Trevelyan, 1946; *The Idea of History*, R. G. Collingwood, 1946.

Hit. Town of Iraq. It stands on the Euphrates, 140 m. N.W. of Hilla and 33 m. N. of Ramadie. Anciently known as Is, and identified by some authorities with Ahava (Ezra 8, v. 15), it is about 85 m. W.N.W. of Bagdad and 70 m. W. of Tekrit, with which it is connected by a desert road. It is famous for its gardens of mulberries and peaches, and is also noted for its wells of bitumen, which the Arabs call the mouths of hell. During the First Great War Hit was occupied in March, 1918, by the British in the course of the operations in Mesopotamia (Iraq) against the Turks. See Mesopotamia, Conquest of.

Hitchcock, ALFRED JOSEPH (b. 1899). British film director. Born Aug. 13, 1899, he was educated at S. Ignatius college, London.

In 1920 he became junior technician at the British studio of Famous Players Lasky, later becoming scenario writer, art director, and production manager for Gainsborough Pictures. During the 1930s he achieved a leading

Hitchin, Hertfordshire. Market square and the parish church of S. Mary

place in British films as director, and his pictures included screen adaptations of *Juno and the Paycock*, and *The Skin Game*; *The Lodger*; *The 39 Steps*, 1935; *Secret Agent*, 1936; *The Lady Vanishes*, 1938. He went to Hollywood in 1939. Later films made in Hollywood and England include *Jamaica Inn*; *Rebecca*, 1940; *Lifeboat*, 1944; *Notorious*, 1947; *Rope*, 1948.

Hitchin. An urban dist, and market town of Hertfordshire, England. It is 32 m. by rly. N. of London, and lies just off the Icknield Way (q.v.). The fine old parish church of S. Mary (formerly S. Andrew's) contains medieval roofs, an ancient font, mosaics, effigies, brasses, and other features of an antiquarian interest. Near by are Golden Square, where Eugene Aram lived, and the wide thoroughfare called Bancroft. On the site of the Baptist chapel in Tilehouse Street once stood a building in which Bunyan preached. Chapman was a resident. Girton College (q.v.), removed to Cambridge in

1872, was established here in 1869. There are a corn exchange and a town hall, library and museum, and the council maintains cattle and general markets and a swimming pool.

Hitchin was known to the Saxons as Hiche, probably from the

little river Hiz, which rises in the vicinity. Edward the Confessor conferred the manor upon Harold: the present lord of the manor is the king. The Priory, a seat of the Radcliffe family, is on the site of a Carmelite monastery, and almshouses include remains of a Gilbertine nunnery. Shandy Hall, residence of the original of Sterne's *Uncle Toby*, has disappeared. Hitchin is a busy agricultural centre, grows lavender and peppermint for distillation, and engages in malting and straw-plaiting. The town gives its name to a co. constituency. Market days, Tues. and Sat. (held in S. Mary's square). Fairs are usually held in May and Sept. Pop. est. 20,000.

Hither Green. Residential district and suburb of S.E. London. It is in the met. bor. of Lewisham (q.v.), 7 m. S.E. of Charing Cross on the electric rly. Here is Park Hospital, a large fever hospital. Mountsfield Park, a pleasure ground of 12½ acres, was opened to the public in 1905.

ADOLF HITLER: FÜHRER OF GERMANY

Edgar Stern-Rubarth, Ph.D.

The life story of the strange fanatic who seized the opportunity given by the disintegration of German society after the First Great War to enslave the Reich and attempt the enslavement of the world. See also Germany; National Socialism; Second Great War, etc.; also Concentration Camp; Gestapo; July Plot; S.S., etc., and biographies of Hitler's associates, e.g. Goebbels; Goering; Hess; Himmler; Ribbentrop

Adolf Hitler, the son of a minor Austrian customs official who had changed his name from Schicklgruber to Hitler, and of his third wife, Clara Poelzl, was born at Braunau, Austria, April 20, 1889. His father died in 1903, and Hitler left the secondary school at Linz after passing through only four classes, to follow art. Apprenticed to a house-painter and paperhanger, he seems to have spent much of his time at home. In 1907 he submitted drawings and paintings to the Vienna academy, with a view to studying there, but was rejected

for lack of talent. He subsequently lived for several years in Vienna, living in doss-houses by peddling postcards he had himself painted, by occasional labour as a bricklayer, and by other odd jobs. There he imbibed the pan-German and anti-Semitic ideas of the Wolf-Schoenerer nationalist party.

At 23 he left Vienna for Munich, continuing to live on casual earnings. The outbreak of the First Great War "enraptured" him and, though he had evaded conscription in Austria, he promptly volunteered for a Bavarian infantry regiment. He served all

through the war, as an orderly, on the Western Front; his record stated that he was a conscientious soldier, but not qualified to be a leader because of his servility to superiors and arrogance to comrades. The iron cross first class which he wore later he secured by subsequent forgery of documents; his rank as *Gefreiter* simply meant that as a soldier of a certain length of service, he was exempted from certain fatigue duties. After the war, he was employed, in the revolutionary days of the Bavarian republic, as spy and *agent provocateur* among the many small political groups that had sprung into being.

In the back room of a beer cellar, a handful of insignificant people under the chairmanship of a certain Anton Drexler, calling themselves the German workers' party, proved receptive of Hitler's ideas, absurd as they seemed at first sight, and of their presentation in a new type of violent oratory. He became the seventh member of the group, increased its membership among unemployed workers, impoverished middle-class people, discharged soldiers, and others, ousted Drexler (1921), and changed the name of the group to National Socialist German Workers' party. In Dec., 1920, he acquired a small local weekly, renamed it *Voelkischer Beobachter*, and used it to spread his ideas.

Ideology of the Nazi System

These, subsequently expounded in his book *Mein Kampf*, can be summarised as follows. All human civilization is the result of race and blood—of an "Aryan" or "Nordic" race, in particular the German or Teutonic. It is faced by a sinister power of destruction, that of the Jews, who, in a secret, worldwide plot, try to destroy the Aryan peoples by bringing about their racial disintegration; France and Soviet Russia were their particular instruments, and the First Great War was an attack organized by "world Jewry" on the German bastion, aided by socialism, communism, freemasonry, and democracy at home—the "stab-in-the-back" myth. A reawakened Germany—to whose leadership he, Hitler, feels called—must therefore suppress the Jews and all other groups and parties; unite all German speaking people in one Reich and—in order to avoid a repetition of William II's blunder in antagonising racially akin Great Britain by naval and colonial ex-

pansion—must seek "living space" in the E. of the Continent. The help of Great Britain and Italy must be secured to destroy France and the "vile Bolshevik regime of sub-humans," and to create Greater Germany, the "Reich of a thousand years." As yet, Hitler did not openly include the churches in his black list, although stressing the note of a specific "Aryan" mysticism derived from primitive Teutonic paganism.

Though his success was then confined in the main to Munich and

tion to destroy it from inside, and altogether unscrupulous in his attacks as well as his promises, he attracted first the craftsmen, shopkeepers, pensioners, and other groups impoverished by inflation by promising to abolish chain and department stores; then the workers hit by mounting unemployment and wage cuts; then the hard-driven peasantry, unsuccessful landowners, and others, pillars hitherto of the conservative National party. The small but important professional army was benevolent; while Hitler's paramilitary organizations, the S.A. and S.S., created by ex-captain Ernst Roehm, increased in strength.

Naturalisation was refused him, but he secured it by taking a minor "token" civil service post in the Nazi-controlled province of Thuringia, and in 1932 stood unsuccessfully against Hindenburg in the presidential election. At a meeting arranged by Papen with Rhenish-Westphalian bankers and industrialists, he forswore such pseudo-socialism as he had preached, and was then helped to power (Jan. 30, 1933) by nationalist plotters around Hindenburg, men who expected to use Hitler and his party as their tools. They were mistaken: Hitler and his lieutenants, first Goering and Goebbels, then Himmler and Ribbentrop, eliminated one rival group after another in rapid succession. Gestapo, concentration camps, S.S., and other means of "persuasion" overcame popular opinion as to Hitler's regime; and on June 30, 1934, he eliminated, in a first mass "purge," potential opponents inside and outside his own party by having massacred from 700 to 1,100 people, including Roehm, von Kahr, and General von Schleicher.

Self-proclaimed Führer

A month later, Aug. 2, Hindenburg died, and Hitler proclaimed himself *Führer* and Reich chancellor of Germany. He sprang one surprise after another upon the world: general conscription in March, 1935; "racial" anti-Jewish laws in Sept.; re-militarisation of the Rhineland, March 7, 1936; annexation by force of Austria, March 12, 1938; a violent campaign for the separation of Sudetenland from Czecho-Slovakia leading to the Munich agreement Sept. 30, 1938, by which Hitler got what he had demanded; the annexation of Czecho-Slovakia, March 15, 1939. A campaign of insult against Poland, with which Hitler had concluded a ten-year pact of non-aggression in 1934,

Adolf Hitler: a studio portrait. Top, characteristic snapshot of the Führer making a speech

surrounding parts of Bavaria, Hitler mistook conflicts between Munich and Berlin, during the peak period of Germany's inflation disasters, for the twilight of the Weimar republic and his chance of seizing power. He tried to involve the Bavarian state commissioner, Dr. von Kahr, and General von Lossow in a rising on Nov. 8, 1923; but they and the troops turned against him, and with Gen. Ludendorff, whom he had won over, he fled, leaving 14 of his associates dead. Captured with others, Hitler was sentenced in April, 1924, to five years' confinement in the fortress of Landsberg, but was released on Dec. 20, 1924, on his promise never again to attempt a *Putsch*.

During that term in a comfortable prison he dictated to Rudolf Hess (*q.v.*) the first volume of *Mein Kampf*; on his release, he set about reconstructing his party (see National Socialism), his propaganda already including mass annual rallies at Nuremberg. Exploiting the complete political liberty granted by the Weimar constitu-

started immediately; and an ultimatum to Lithuania gave him Memel, March 22; a pact followed with his former arch-enemy, Soviet Russia, on Aug. 23; and on Sept. 1 came the annexation of Danzig and the invasion of Poland. Anyone who objected, or who resisted his course of action, was swept aside or eliminated.

Hitler, who had never previously travelled, visited in triumph the capitals successively conquered by his armies, until, after repeated attempts to take Moscow had failed, he dismissed F.-M. von Brauchitsch, Dec., 1941, assumed command of the German forces in person, making his H.Q. on the Eastern Front, and in April, 1942 received from the Reichstag the title "supreme war lord." The end of 1942 saw the German war reach its limit, and begin to fall back. Reverses followed at a growing pace. Hitler continued to direct the armies personally, but his public utterances came at longer intervals. Then, on July 20, 1944, a plot, long matured, came to a head in an attempt to kill Hitler with a bomb. It failed: Hitler was merely wounded. But another purge swept away thousands of his actual and potential enemies at home. (See July Plot.) In Nov. he issued a proclamation declaring that Germany was "fighting for her life."

The Allied advance into Germany itself continued from E. and W., until the two forces met on April 25, 1945. On the same day Berlin, where Hitler remained with a few faithful followers, including Bormann and Goebbels (*q.v.*), in the air raid shelter under the chancellery, was encircled by the Red

army. He was married to Eva Braun, one of his few intimate friends, in the evening of April 29, and next day, April 30, 1945, they both died—presumably by suicide. Their bodies were burned in the chancellery courtyard.

Hitler's personal faithlessness, his complete lack of scruple in giving and breaking the most solemn pledges, his egocentric and maniac way of speaking and behaving, his conceit, and his frequent raving fits, stamp him as mentally unbalanced; yet he had gifts that fascinated. He could offer his audiences the most effective, if primitive, arguments, varied according to their composition; he staged his mass demonstrations with almost unparalleled showmanship; and he had an almost hypnotic power of presenting himself either as an ascetic, stern, strong leader of the nation, or as a kind, humane, warmhearted individual. He exploited his powers of oratory, his capacity for gesture, even his raving fits, to exert a kind of magnetic spell upon his audience, preventing it from applying common sense to his arguments and dicta. Wholly unscrupulous in the choice of his lieutenants, he dominated them by craftily playing one against another. That he believed implicitly in himself and his "mission" there can be no doubt. Consult Hitler, A Biography, K. Heiden, 1938; Last Days of Hitler, H. R. Trevor-Roper, 1947.

Hitler Line. German defence zone of the Second Great War in Italy. Designed as a secondary defence to the Gustav line (*q.v.*), the Hitler line lay across the valley of the Liri in the form of an arc

with a front of c. 15 m. and a depth of c. 2½ m., its right flank resting on Mt. Fammara, its left on Mt. Cairo. The towns of Esperia, Pontecorvo, and Aquino were within the zone, which, like the Gustav line, covered Highway 6, the main road to Rome. On May 22, 1944, the 8th army attacked in strength the strongest section of the Hitler defences, smashing right through them on May 24,

and capturing on the 25th Pontecorvo and Aquino, virtually destroyed in the fighting. The overrunning of the Hitler line left the road to Rome open except for minor defences in the Alban Hills. See Italy, Campaign in.

Hitler Plot. Plan to murder Adolf Hitler and destroy the Nazi regime in Germany, which matured on July 20, 1944. See July Plot.

Hitler Youth. German organization created by and affiliated to the National Socialist party. After Hitler's seizure of power, in 1933, it embraced virtually every German child and young person, all Christian, Socialist, and other youth organizations being abolished. It provided physical training, but its chief purpose was the indoctrination of members with Nazism. It was divided into *Jungvolk*, aged 8 to 14, *Hilfsljugend*, the Hitler Youth proper, boys from about 14 to 18, and *Bund Deutscher Mädel*, for German girls. Each section had its brown uniform and its badges and pseudo-military ranks; all three were under strict discipline, their gatherings, marches, etc., being obligatory. The first Reich leader was Baldur von Schirach, the second, from 1938, Arthur Axmann. It disappeared, with the National Socialist party, when the Allies occupied Germany, 1945.

Hitopadesa. Sanskrit collection of animal stories told with moral purpose, the title signifying "salutary counsel." A popular summary of the Panchatantra, it includes many of the fables associated with the legendary Bidpai, and is supposed to have been compiled by the Brahman Vishnunarman. Eng. trans. F. Johnson, 1847. See Panchatantra; Sanskrit.

Hitteren. Large island off the W. coast of Norway. Situated S.W. of the entrance to the Trondhjem Fjord, it is 30 m. long and 10 m. wide, its area, including adjacent small islands, being 203 sq. m. The island, which contains numerous streams and lakes, is hilly, rising in parts to over 1,000 ft. Fishing is extensively carried on and deer abound.

Hittites. Ancient people in W. Asia. The Biblical names, Heth and Hittite, denoted at first diverse racial elements in pre-Israelite Canaan and afterwards various N. Syrian tribal confederacies. They are identifiable with the Kheta of Egyptian annals and bas-reliefs, and the (K)hatti of Assyrio-Babylonian records. Denoting primarily a dominant tribe in the Halys plain, the name

Hitler. The Führer being greeted by his supporters in the notorious beer cellar at Munich

Hittites. Reliefs from Carchemish, the Hittite city. 1. A warrior. 2. Winged sphynx or chimaera. 3. Warriors in procession. 4. Two winged demons. 5. The citadel mound of Carchemish from the north. 6. Hieroglyphic inscriptions. 7. Reliefs depicting family life.

By courtesy of the Trustees of the British Museum

sometimes embraces the confederacies of city states whereof this tribe usually formed the head.

Eastern Asia Minor was occupied in prehistoric times by agricultural slender-limbed long-heads related to the neolithic brown race of the Mediterranean region, Elam, and W. Turkistan. They were subjugated by scattered immigrant bands of sturdy, alpine round-heads from Armenia and the Caucasus, who were aided by a knowledge of implements and weapons of the early copper-age culture.

They also bred and harnessed the horse, which long afterwards was imported from them by Solomon (1 Kings 10).

Well established by the end of the 3rd millennium B.C., this early Cappadocian activity, through one of its offshoots, overturned the first dynasty of Babylon about 1925 B.C. But its efforts to secure political cohesion were impeded by the mountain barriers, while the nations around possessed the advantage of sea and river communications. The upland tribes accord-

ingly tended to segregate into independent city states. At length, about 1400, a dynasty was founded by Subbiluliuma, who welded his neighbours into a close-knit kingdom, organized into princedoms and prefectures, wherein women were accorded official rank. This kingdom reduced the Mitannian kingdom in N. Mesopotamia to a protectorate, held Kadesh as a frontier-outpost, made treaties on equal terms with Egypt, maintained relations with Babylon, and lasted until overthrown in 1200

by the Mushki. For a time Hittite lands played an unimportant rôle, but by 1000 their activities revived under the spur of an early Iron-age culture until Carchemish, in 717, and Marash, in 709, were overthrown. This later period is preferably called post-Hittite.

The recognition of a distinctive sculptural art at Hamath, Marash, and elsewhere led Sayce, in 1880, to outline this forgotten empire. Besides the remains noticed under Boghazkoi, Carchemish, Marash, Sakjegeuzi, and Sinjerli, the rock-sculptures of Ivriz and Karabel, the double-headed eagle and bull-sphinxes of Euyuk, are notable.

The prominent nose and squat build, the high cheek-bones and black pigtailed hair, the conical cap and upturned shoes, the dirk and double-axe, the horsed chariot and four-wheeled cart of Hittite monuments seem to betoken eastern contact. But the features formerly held to prove a mongoloid descent characterise upland dwellers elsewhere, and the qualities of leadership point to Caucasian rather than Tartar overlordship. The art manifests the transmission of ideas both from and to S. Mesopotamia and the pre-Hellenic Aegean. The Assyrian script was adapted to the local dialect. The religion was based upon the primitive Anatolian cults, which gave prominence to the earth-mother and the worship of a sky-god Teshub, allied to Thor. *See* Assyria; Babylonia; Palestine; *consult* The Hittite Empire, J. Garstang, 1929. *See* N.V.

Hiungnu or **HSIUNGNU**. Ancient nomadic pastoral nomads of Altaian stock in central Asia. They were skin-clad archers, without villages or agriculture. The construction of the Great Wall c. 214 B.C., followed shortly after by another in Chinese Turkistan (Sinkiang), frustrated their southward raids, and led to their migration westward. *See* Uigur.

Hivites. One of the ancient tribes driven out of their territory by the Hebrews on their invasion of Palestine. Gibeon and Shechem were two of their chief centres. *See* Palestine.

Hjelmars. Lake of S. Sweden. It is 40 m. W. of Stockholm, and S.W. of Lake Mälars, with which it is connected by a canal and the Arboda river. It is some 39 m. long by 13 m. wide, having an area about 195 sq. m.

Hlinka, **ANDREW** (1864–1938). Slovak ecclesiastic and politician, born at Cernov. Ordained an R.C. priest in 1889, he began his political

championship of the Slovaks in the days of the Austro-Hungarian empire. Following the creation of Czecho-Slovakia in 1918, he became leader of the Slovak clerical party, whose aim was autonomy. This went into opposition to the Czech clericals in 1929, and there was formed a semi-military organization called the Hlinka Guard.

Hlinka died Aug. 16, 1938, the leadership of the party passing to Father Tiso. After the Munich pact and the dismemberment of Czecho-Slovakia, the Hlinka Guard organized Slovakia on Nazi lines, and a revolt which it instigated gave Hitler the pretext for invading the country. When in 1940 Slovakia joined the Axis, the Hlinka Guard was absorbed into the German war machine.

Ho. Primitive forest tribe in the Singhbhum district of Chota Nagpur, Bihar province, N. India. Skilful archers, numbering perhaps 500,000, they speak a Munda dialect and show less Hindu influence than the related Santals.

Hoadley, **BENJAMIN** (1676–1761). English prelate. Born at Westerham, Kent, Nov. 14, 1676, he was educated at Catharine Hall, Cambridge. A strong politician, he supported the accession of the house of Hanover to the British throne, being rewarded with the bishoprics successively of Bangor, Hereford, Salisbury, and Winchester. He was a thorough-going Erastian, and his theological views were nearly akin to those of the Unitarians. One of his sermons led to the Bangorian Controversy (*q.v.*), in which Hoadley held that sincerity was the true basis of Christianity. Died at Chelsea, April 17, 1761.

Hoare, **SIR SAMUEL**. British politician who took the title of Viscount Templewood (*q.v.*). **Hoare-Laval Pact**. Proposals put forward, Dec., 1935, by Sir Samuel Hoare, U.K. foreign secretary, and Pierre Laval, French foreign minister, for ending the Italo-Abyssinian War. Their recommendation that Abyssinia should surrender territory to Italy appeared to reward aggression, and the proposals were so widely and bitterly attacked that on Dec. 18 Hoare resigned and on the 19th the premier, Stanley Baldwin, declared that "these proposals are absolutely and completely dead."

Benjamin Hoadley,
English prelate
After Hogarth

Hoar Frost (A.S. *har*, white). Deposition of ice particles on surfaces when the dew point is below 32° F. The ice particles or crystals readily form like needles and feathers on the branches of trees, leaves of grass, etc. The heaviest hoar frosts are formed when the heaviest dews occur, on clear, calm nights, when radiation is little impeded. No distinction is made between frozen dew and ice formed directly from cooled water vapour. *See* Dew; Frost; Ice.

Hoarseness. Roughness of the voice, usually due to laryngitis. It may often be relieved by inhaling steam from a jug of boiling water to which a teaspoonful of tincture of benzoin (friar's balsam) has been added. Hoarseness is often associated with a septic focus of dental origin. If recurrent and intractable, it should arouse suspicion of cancer or tuberculosis of the larynx. *See* Friar's Balsam; Laryngitis; Voice.

Hoar-Stone. Unhewn pillar-stone, standing alone, often hoary with lichen. It is usually a Neolithic menhir, sometimes with the derivative purpose of a memorial or landmark, such as the Haranstan of the Ethelwulf charter of A.D. 847. The word designates two Worcestershire hamlets, a Gloucestershire menhir, and a long barrow at Duntisborne Abbots.

Hoatzin. South American bird of the family Opisthocomidae. Related to the game birds, it is about the size of a pigeon, and resembles a small broad-tailed pheasant with an erectile crest on its head. The plumage is olive

Hoatzin. S. American bird

with white markings above and reddish below, and there is a naked patch on the breast.

Hobart. Capital and second oldest city in Tasmania. It is situated on the S. side of the island at the foot of Mt. Wellington, on the Derwent, 12 m. from its mouth. It is a port of call for European mail steamers and for Australian inter-state steamship liners, and is the rly. centre for

Hobart, Tasmania. A general view of the city, showing Mount Wellington in the background

Tasmania. Its beautiful harbour, deep and well sheltered, gives a fine setting to the city and its government house, parliament, university, and other fine public buildings. Industries include tanneries, foundries, saw-mills, breweries, flour mills, and fruit-preserving

Hobart arms

factories, and the principal exports are apples, jam, tin, zinc, copper, newsprint, and timber. Hobart's climate, comparable to that of the south of England, and fine scenery attract visitors from the northern states. Pop. 71,910.

Hobart-Hampden, AUGUSTUS CHARLES (1822-86). British sailor, commonly known as Hobart Pasha. The third son of the 6th earl of Buckinghamshire, he was born April 1, 1822, and entered the navy in 1835. In the Russian war he served in the Baltic and at the siege of Bomarsund, 1854. Captain in 1863, he retired on half-pay and, being a keen partisan of the Secessionists in the American Civil War, obtained the command of a blockade runner. In 1867 he became naval adviser to the sultan of Turkey, was promoted admiral and pasha in 1869, and reorganized the Turkish navy. He died at Milan, June 19, 1886.

Hobbema, MEINDERT (1638-1709). Dutch painter, born at Amsterdam, Oct. 31, 1638. He was the friend, possibly the pupil, of Ruysdael, whom he accompanied on painting expeditions, and though ignored by patrons enjoyed the friendship of Wouverman and the van de Velde, who painted figures and animals for his compositions. The period of his activity lasted till about 1669, when he took an official post, dying at his birthplace, Dec. 7, 1709. Essen-

Hobbes, JOHN OLIVER. Pen-name of the British novelist, Pearl Mary Teresa Craigie (q.v.).

Hobbes, THOMAS (1588-1679). English philosopher. Born at Malmesbury, April 5, 1588, and educated at Magdalen Hall, Oxford, he became in 1610 tutor to the grandson of the Duke of Devonshire. The connexion thus formed with the Cavendish family was maintained intermittently during the rest of his life. His next pupil was the son of Sir Gervase Clifton, and in 1631 he became tutor to the son of his

first pupil. On each occasion a continental tour was part of the scheme of education. Both at home and abroad Hobbes met some of the most eminent men of the time—Jonson, Bacon, Galileo, Descartes, and Selden. For Galileo whom he met in Florence, 1636, he always had the greatest admiration.

His first objects of study were classics and mathematics—he issued in 1628 a translation of Thucydides—but it is as a political

philosopher that Hobbes is chiefly remembered. In 1640 he wrote a defence of monarchy, published later as two separate treatises entitled *Human Nature* and *De*

Corpore Politico (On The Body Politic). In view of the political situation Hobbes thought it wise to leave England after this revelation of his opinions, and spent the next eleven years abroad. He returned to England in 1651, made his peace with the Commonwealth, and after the Restoration received a pension from Charles II, whose mathematical tutor he had been in 1646-48. In 1651 his greatest work, *The Leviathan*, had appeared, and though the political theories were acceptable to the monarchy, the Church accused its author of atheism. Hobbes died at Hardwicke, Dec. 4, 1679.

Thomas Hobbes,
English philosopher
After Dobson

In his system of ethics, Hobbes reduces everything to terms of self-interest, e.g. friendship is merely the sense of mutual dependence, and religion is essentially fear of inscrutable powers. He conceived mankind as living originally in a state of anarchy in which "the whole life of man is solitary, poor, nasty, brutish, and short." To abolish this anarchy and its resultant evils individuals agreed to resign the rights to a sovereign power, not necessarily one man, and the sovereignty thus created for the common weal must be despotic and irrevocable.

This political theory, though partly vitiated by the fact that it is quite unhistorical, exercised an extraordinary though largely negative influence upon subsequent thinkers such as Rousseau, while disagreement with Hobbes's purely ethical conclusions proved to be a most stimulative influence in the realm of ethical speculation. Hobbes's style is unadorned but amazingly clear and forceful. See *Leviathan*; consult also Hobbes, G. Croom Robertson, 1886; Life, Leslie Stephen, 1904; Hobbes the Philosopher, J. Laird, 1934.

Hobbs, JOHN BERRY (b. 1882). English cricketer. Born at Cambridge, Dec. 16, 1882, son of a groundsman at Fenner's, he was cricket coach at Bedford grammar school at 19. Encouraged by Tom Hayward, he became a professional

J. B. Hobbs,
English cricketer

player, offering himself to Essex, who declined, but being accepted by Surrey in 1903. Probably the most attractive as well as consistent batsman who ever opened an innings, by 1907 he was playing for England at Melbourne, Australia. His career, lasting until 1934, brought him over 60,000 runs, including 197 centuries, both unparalleled achievements. A remarkable year for Hobbs was 1925, when he headed the averages, totalled 3,024 runs, made 16 centuries (a record which stood 22 years), and passed Grace's tally of 126 centuries. His highest innings was 316 not out, at Lord's in 1926, a record for the ground. The last of his 41 appearances against the Australians was at the age of 47. As a fieldsman at cover point he was unsurpassed. Hobbs wrote several books of reminiscences, notably *My Life Story*, 1935; also the article on Cricket in this Encyclopedia.

Hobby (*Falco subbuteo*). Migratory falcon found in the southern districts of England during the summer. Of graceful shape, about a foot in length, and of reddish colour with white throat and breast, it feeds upon small birds and insects and is useful to the agriculturist. It was formerly used in hawking (*q.v.*).

Hobby-Horse. Old-time feature at fairs, pageants, and other popular festivities. It consisted of

Hobby-Horse. An old English figure
From a print published by T. Tegg in 1839

a gaudily coloured pasteboard or wooden figure of the head and hind quarters of a caparisoned horse girt round the waist of a performer, who imitated the curvettings of the animal.

The character appears with the other persons of the morris dance on a painted window of a house at Betley, Staffs. "Hobby-horse" was one of the names given to the

"draisive," an early form of bicycle propelled by the feet, invented by Baron von Draiss, and also denotes a toy horse, and the horse of the merry-go-round. Like the modern "hobby," the term has been applied to a favourite occupation or topic. Hobby comes from mid. Eng. *hobin*, perhaps a corruption of Robin, a name given to a horse. See Bicycle.

Hobday, SIR FREDERICK T. G. (1870-1939). British veterinary surgeon. After leaving Burton grammar school he worked in an office, but was apprenticed to a local veterinary surgeon and studied at the Royal Veterinary College, qualifying in 1892. He became honorary veterinary surgeon to the king, principal of the R.V.C., and honorary fellow of the Royal Society of Medicine. In the First Great War he served in France, Flanders, Italy, and Albania. Knighted in 1933, he received honours from several foreign countries. His autobiography, *Fifty Years a Veterinary Surgeon*, was published in 1938, and he was editor of the *Veterinary Journal*. He died June 24, 1939.

Hobgoblin. Traditional elf or goblin, generally of terrifying appearance. The prefix, *Hob*, is probably a corruption of Robin, and the name may have originally represented only the Robin Good-fellow of English folklore.

Hobhouse, ARTHUR HOBHOUSE, BARON (1819-1904). British lawyer. He was born at Hadsden, Somerset, Nov. 10, 1819. Educated at Eton and Balliol College, Oxford, he became a barrister, soon enjoyed a large practice in the chancery courts, and took silk in 1862. In 1872, having then retired from work, he was appointed legal member of the council of India, but his best work was done between 1881 and 1901 as a member of the judicial committee of the privy council. In 1877 he was knighted, and in 1885 he was made a baron. The title expired with him, Dec. 6, 1904.

Hoboken. City of New Jersey, U.S.A., in Hudson co. It stands on the W. of the Hudson river, adjoining Jersey City and opposite New York, with which it is connected by ferries, the Hudson and Manhattan tubes, and the Holland

Baron Hobhouse,
British lawyer

tunnel. It is a terminus of several rlys. With an area of 1.3 sq. m. and a pop. of 50,115, including Italian, German, Irish, and Polish elements, Hoboken is the most densely populated city in the U.S.A.

Hoboken occupies the site of a Dutch farm razed by the Indians in 1643. It was laid out as a town in 1804, incorporated 1849, and received its charter in 1855. Once fashionable, it is now an industrial and shipping centre, with foundries, light and heavy engineering works, and factories for leather, silk, chemicals, pencils, and waterproof fabrics. During the First Great War it was the chief troop embarkation point. A dock fire in 1900 caused damage valued at £2,500,000.

Hobson, RICHMOND PEARSON (1870-1937). U.S. sailor. Born in Alabama, Aug. 17, 1870, he was educated at the U.S. naval academy, afterwards studying for his profession in Paris. He became a constructor, but saw active service in the war against Spain, being at the bombardment of Matanzas and the expedition against San Juan de Puerto. His great exploit was sinking the Merrimac on June 3, 1898, at the entrance to Santiago Harbour, this being an attempt to shut in the Spanish fleet. This feat made him the idol of America. In 1903 he retired from the service, and during 1906-15 sat in congress for Alabama. He died in 1937.

Hobson, THOMAS (c. 1544-1631). Cambridge carrier and livery-stable keeper. His invariable refusal to allow any horse to be taken from his stables except in its proper turn is said to have given rise to the expression, Hobson's choice, i.e. take it or leave it. He continued his journeys to London until 1630, when they were suspended on account of the plague. Milton wrote two humorous epitaphs on him, and a street and conduit in Cambridge are named after him.

Hobson-Jobson. Anglo-Indian term denoting a native festal excitement, especially during the Moharram celebration of the death of two of Mahomet's grandsons. It is the British soldiers' version, traceable back to 1829, of the wailing cry Ya Hasan, Ya Hosain. Earlier variants were Hosy Gossy, 1673; Hossein Jossein, 1720; and the Dutch Jaksom Baksom, 1726. The term was chosen by Sir H. Yule and A. C. Burnell as the title of their glossary of colloquial Anglo-Indian words and phrases, rev. ed. 1903.

Hoche, LAZARE (1768-97). A French soldier. Born near Versailles, June 25, 1768, he was in the Guard before the Revolution. He remained in the army after the fall of the monarchy, and in 1792 became an officer. Almost at once he was made a general and placed at

the head of an army. In the winter of 1793-94 he won several brilliant victories over the Austrians and Russians, but was imprisoned as a traitor. He was speedily released and in the field against the royalists in arms in La Vendée. Hoche was successful there, but met with failure when he organized and led an expedition to invade Ireland in 1796. He was afterwards in a command on the Rhine. Hoche had just resigned the post of minister for war when he died at Wetzlar, Sept. 19, 1797. It was thought that his career might have rivalled Bonaparte's had he lived, and he was one of the more attractive figures of the Revolution. *Prom. Ohsh.*

Hochelaga. Name of a suburb of Montreal and of a county in the island of Montreal, Canada. It preserves the name of a native village inhabited by the Hochelaga or Beaver Indians. Jacques Cartier found the place in 1535, and in 1642 Montreal was founded.

Hochkirch or HOCHKIRCHEN, BATTLE OF. Fought during the Seven Years' War, Oct. 14, 1758, between the Prussians on the one side and the Austrians and their allies on the other. Hochkirch is a village near Dresden. After his victory over the Russians at Zorndorf on Aug. 25, Frederick the Great hastened to the help of his brother Henry, whose army covering Dresden was faced by a much stronger one. Frederick decided to attack, but by a coincidence, Daun, the Austrian leader, made the same resolve. The result was a desperate encounter on the morning of Oct. 14, the Austrians having used the night to surround their foes. The Prussians fought well but were driven from the field, leaving many guns as spoil. They lost about 10,000 men out of 40,000 engaged; the Austrians 7,500 out of 80,000-90,000. *See* Seven Years' War.

Höchst. German town, on the Main, at its junction with the Nidda. It was a co. when incor-

porated in 1928 as a borough with Frankfurt. Originally a Carolingian settlement, it has a church, S. Justinus, dating from the 9th century, a monastery of 1441, and a partly destroyed castle that was a residence of the Mainz archbishop-electors. It was the seat of one of the three main plants of the I.G. chemical trust, and of great engineering works, as well as of one of the early factories of fine porcelain (1746-98). Here in 1622 the Imperialists under Tilly defeated the Protestants; and in 1795 the Austrians, the French.

Höchstädt. An old Bavarian town on the Danube, 55 m. N.W. of Munich, at a height of 1,400 ft. It has two Gothic churches of the 12th and 13th centuries, and a castle of the 16th. Industry is connected with agriculture. Höchstädt is known in connexion with the battle called by the English Blenheim (after the village of Blindheim), Aug. 13, 1704. Pop. 2,186. *See* Blenheim, Battle of.

Hock. German white wine, grown in the Rhine district and locally known as *Hochheimer*, from Hochheim, on the Main. The anglicised name hock is now applied generally to all Rhine white wines. Most of these can be had either still or sparkling, among the best of the former being Liebfraumilch and Marcobrunn; of the latter, Johannisberg, Liebfraumilch, and Ehrenbreitstein. Hock has a characteristic flavour and bouquet; it is a full-bodied, stable wine, containing 9-12 p.c. alcohol. Similar wines, made in Australia, California and elsewhere from the hock or Riesling vine, are usually sweeter than the Rhine wines.

Hockey (Eng. hook; Fr. *hoquet*, crook). Outdoor game played for centuries in various countries under various names. In Ireland a similar game is known as hurley, in Scotland as shinty, in Wales as bandy. The earliest form of the game is traceable to Ireland, and appears to have been originally played by one individual against another. The Irish game is referred to in the will of the first Irish king, Cathair Moir (d. 148). Cathair gave Crimthaun 50 hurling balls made of brass, with an equal number of hurlets.

There is an altar pot in the Copenhagen national museum made c. 1330, on which are depicted two hockey players with sticks and a ball, apparently bullying in the modern style. In a wall built at Athens by Themistocles (514-449 B.C.) a bas-relief has been found showing two

youths with hooked sticks similarly engaged, two others behind them holding hooked sticks. Fourteenth-century windows in Canterbury and Gloucester cathedrals show a boy striking a ball with a hooked stick.

Hockey. Plan of the field with dimensions laid down by the Hockey Association

As now played, hockey became a recognized game about 1883, when a standard set of rules was framed by a Wimbledon club. In the same year the game was adopted by Cambridge university, and later by Oxford; the first inter-varsity match being played in 1890. On Jan. 18, 1886, representatives of eight clubs met at the Holborn Restaurant, London, and the Hockey Association was founded, its principal object being to consider draft rules. The organization of the association gave a great impetus to the game, and Irish, Welsh, and Scottish, as well as English divisional and county associations quickly sprang into existence.

Representative games were started in 1890, teams from the N. and S. of England being opposed. In 1895 the first international game was decided, England defeating Ireland at Richmond by five goals to nil. In 1900 an international board was formed to make and alter rules of the game. The hockey associations of England, Ireland, Scotland, and Wales all appoint representatives to the board, which is under their control. Hockey is included in the Olympic games.

Hockey is played between two teams of not more than eleven players each. The object of the game is to force the ball into the opponents' goal. The team scoring the most goals wins. Correct formation of a team is five forwards, three half-backs, two backs, and a goalkeeper. A game lasts 70 mins., the teams changing ends after 35 mins. The dimensions of the ground are: length, 100 yds., breadth, 55-60 yds. It is rectangular, as in football, the longer boundary lines being called side-lines and the shorter, goal-lines. The goals are 12 ft. wide and 7 ft. high, and should be fitted with good nets.

In front of each goal is drawn a line 4 yds. long and 3 ins. wide parallel to and 15 yds. from the goal-line. This line is continued at both ends to the goal-line by drawing quarter circles (3 ins. wide) with the goal-posts as centres. This constitutes the

striking circle. The ball is of the same size as a cricket ball, covered in white leather or leather painted white; it may be seamless or sewn. The sticks are of ash, have a flat front surface and curved blade, and may not weigh more than 28 oz. They must pass through a ring with a diameter of 2 ins.

Outline of Play

Bully. The game is started by a bully in the centre of the ground. One player from each team takes part in the bully. They stand squarely facing the side-lines. Each taps first the ground on his own side of the ball and then his opponent's stick three times alternately, after which one of them must play the ball with his stick, before it is put into general play.

Goal. A goal is scored when the ball passes between the uprights below the cross-bar, and wholly over the goal-line, the ball having been hit or touched by the stick of

Hockey. Typical scenes in the game. 1. The bully off. 2. A player secures the ball. 3. Play near the goal. 4. Goalkeeper effecting a clearance. 5. A stiff tussle in mid-field

an attacker while within the striking circle.

Corners. When the ball is sent over the goal-line by or off an attacker or by a defender unintentionally from a distance of 25 yds. or more from the goal-line, a bully takes place 25 yds. from the goal-line in a direct line from where the ball went over. When a defending player sends the ball over his own goal-line unintentionally from a distance of less than 25 yds. from the goal-line, the penalty is a corner hit. This is a free hit by an attacker (usually an outside-forward) from a point on the back-line or side-line not more than 3 yds. from the corner flag. If the ball is sent intentionally over the back-line by or off a defender, a penalty corner is given, which is taken from any spot on the defenders' goal-line on either side of the goal, but not within 10 yds. of a goal-post.

All defenders must stand behind their goal-line, and attackers must stand outside the circle. From a corner hit no shot at a goal may be made until the ball has been stopped (not necessarily motionless) on the ground by an attacker or hit after it has struck or been played by a defender.

Roll-In. When the ball is played over either side-line, it is rolled in, not bounced, by a player of the opposing team from the point on the line at which it left the field of play, no other player standing within 7 yds.

Offside. A player is offside when the ball is hit or rolled in unless there are at least three opponents between him and his opponents' goal, or the striker or roller-in be nearer to the opponents' goal-line. The penalty is a free hit to the opposing team at the spot where the offence occurred. No player can be offside in his own half of the field.

Offences. The rules, in the interests of the game and of safety, place various restrictions on the manner in which the game is to be played, in addition to those (e.g. offside) mentioned above. They are: a player (1) may not play left-handed; (2) may not raise his stick above his shoulder; (3) may not undercut the ball; (4) may not intentionally use any part of his body, except his hand, to stop the ball; (5) may not kick or carry the ball; (6) may not hook, hold, or strike at an opponent or his stick; (7) may not obstruct an opponent by imposing his body or stick to prevent the

opponent from playing the ball; (8) may not interfere with the game unless with stick in hand.

The goalkeeper is permitted to kick, but only when in the striking circle; rough or dangerous play is not permitted.

The umpire is to refrain from enforcing a penalty where it would be giving an advantage to the offending team.

Penalties. In breaches outside the circle, a free hit is awarded to the opposing team. Inside the circle for a breach by an attacker, a free hit is also awarded. For a breach by a defender in the circle, a penalty corner or a penalty bully is awarded to the attacking team. For a simultaneous breach, the game is restarted by a bully on the spot where the breach occurred, except that no such bully is to be played within 5 yds. of the goal-line. A penalty bully is awarded for an intentional breach by a defender in the circle to prevent a goal from being scored, or where a goal would probably have been scored had an unintentional breach not occurred.

The penalty bully is taken by the offender (unless he has been incapacitated or suspended), and any attacker on a spot 5 yds. in front of the centre of the goal-line. Until completion of the bully, all the other players remain outside the nearer 25 yds. line.

If during the bully the ball pass wholly (1) over the goal-line or under the cross-bar, off the stick of the attacker or stick or person of the defender, a goal is scored; (2) over any part of the goal-line within the circle, off the stick or person of the defender, the bully is taken again; (3) outside the circle in all other cases, the game is restarted by a bully at the centre of the nearer 25 yds. line.

In case of a breach during the bully (a) by the attacker, the game is restarted by a bully at the centre of the nearer 25 yds. line; (b) by the defender, a goal is awarded; (c) simultaneously, the bully is re-taken.

D. O. Light

HOCKEY FOR WOMEN. Although originally for men only, hockey was recognized as a suitable pastime for women, and in 1895 the All-England women's hockey association was formed. In the same year ladies' teams from England and Ireland met at Brighton. There are also associations for women's hockey in Ireland, Scotland, Wales, and other countries; most are affiliated to the inter-

national federation of women's hockey associations. The rules of the game are slightly different from those for men. *See also* Hurling; Ice Hockey.

Hocking, JOSEPH (1855-1937). British nonconformist minister and novelist. Born in Cornwall, a brother of Silas Hocking, he was educated at Victoria university, Manchester, and for a time was a land surveyor. In 1884 he became minister of a Methodist church, and was a popular preacher. It is chiefly by his novels that he is generally known, his first story, *Jabez Easterbrook*, 1891, having been followed by at least one work of fiction annually for some 40 years. Many of these attained wide popularity as serials and in volumes. He died March 4, 1937.

Hocking, SILAS KITTO (1850-1935). British novelist. Born in Cornwall, March 24, 1850, and educated privately, he was ordained minister of the United Methodist Church in 1870, and held various pastorates until 1896, when he retired. His first story, *Alec Green*, appeared in 1878,

Silas K. Hocking,
British novelist
Russell

and was followed by *Her Benny*, 1879, this being the first of a sequence of novels, chiefly of a religious tendency, which enjoyed wide popularity. Hocking twice stood for parliament, and in 1923 published *My Book of Memory*. He died Sept. 15, 1935.

Hockley-in-the-Hole. Former name of Ray Street, Clerkenwell, London, E.C. Notorious in the 17th and 18th centuries as a resort of thieves, highwaymen, bull-baiters, bulldog breeders, and infamous women, it had a bear garden which all classes patronised, where prize-fighting, cock-fighting, wrestling, and duels took place.

Hocktide. Old English holiday observed on the second Monday and Tuesday after Easter. Formerly, in rural districts, Hock Tuesday was one of the days on which rent and other regular charges were paid. On Hock Monday it was the custom for the men to bind with ropes every woman or girl they met, releasing her on payment of a small sum of money, which was given to the Church. On Hock Tuesday the women bound the men.

The custom apparently originated about the 12th century, and

died out early in the 18th. In London in the 15th and 16th centuries Hooktide was called Hobtide. The old Coventry play of Hook Tuesday, performed before Queen Elizabeth at Kenilworth in 1575, represented Saxons fighting with Danes and Saxon women binding and leading the Danes captive.

Hodder & Stoughton. London publishing house, founded by Matthew Hodder and T. W. Stoughton in 1868. In 1902 John Ernest Hodder-Williams, who was knighted in 1919, joined the firm. Initial success was achieved with *From Log Cabin to White House*, a memoir of President Garfield by W. M. Thayer. In 1885 the Rev. (later Sir) William Robertson Nicoll (*q.v.*) became editor in chief and literary adviser. In 1886 he started *The British Weekly*, through which he speedily made himself the chief nonconformist journalist, and a few years afterwards *The Bookman*. The firm became a limited company in 1919 and added several subsidiary book publishing companies through the years. The parent firm developed a large output of fiction, religious books, and biographies. After *The Bookman* was sold in 1935 and *The British Weekly* in 1946, it concentrated entirely on books.

Hoddesdon. Town and (with Broxbourne and Wormley) urban district of Hertfordshire, England. It is on the river Lea, 4 m. S.E. of Hertford, on the railway, and was a fishing resort of Izaak Walton, in whose book it is mentioned. On the N.E. border is the building which gave its name to the Rye House Plot (*q.v.*). Broxbourne Woods cover 300 acres. Market day, Wed. Pop. 12,760.

Hodeida. Seaport of Arabia. It lies about 150 m. N. by W. of the strait of Bab-el-Mandeb, in the Yemen, on the E. coast of the Red Sea. The Turks had a fort here. It has some trade, exporting coffee, hides, cotton, millet, and senna. It was occupied during the First Great War by a British garrison, which was attacked by the Imam Yehia, head of the Zaidi sect of Muslims, in Aug., 1919. The British evacuated it in Jan., 1921. *See* Yemen.

Hodge. Character in William Stevenson's comedy, *Gammer Gurton's Needle*, 1575. He is Gammer Gurton's servant and his name, a nickname for Roger, has since served as a conventional designation for an English farm labourer or countryman. Regarded as more or less of a simpleton, he was customarily given things of inferior

quality under the belief that he would not know the difference, hence the hodge razors referred to in Carlyle's *Miscellanies*, which were never meant to shave but only to be sold.

Hodge, JOHN (1855-1937). A British labour leader. Born at Muirkirk, Ayrshire, Oct. 29, 1855, he was educated at Motherwell and Glasgow. He formed and became secretary of the British Steel Smelters', Mill, Iron, and Tinplate Workers' Association; and was president of the T.U.C. in 1892, and of the British section of the international congress at Zürich, 1893. He was elected M.P. for Gorton in 1906, and was minister of labour, 1916-17, transferring then to the ministry of pensions. When the Labour party decided not to join the Lloyd George ministry in 1919, Hodge resigned. He lost his seat in 1923, and died at Bexhill, Aug. 10, 1937. An autobiography, *Workman's Cottage to Windsor Castle*, appeared in 1931.

Hodges, FRANK (1887-1947). British politician. He was born at Woolaston, Glos, April 30, 1887, and went to an elementary school at Abertillery and Ruskin College, Oxford. Having worked as a collier and miners' agent, he became general secretary of the Miners' Federation of Great Britain, 1918-23, and of the Miners' International Federation, 1920-27. In the former capacity he refused to press for a national wages pool during the coal disputes of 1921. Returned to parliament by Lichfield in 1923, he was civil lord of the Admiralty in the first Labour government. Later he left the Labour movement, becoming a director of companies, a member of the Central Electricity Board and of the industrial court. He wrote *My Adventures as a Labour Leader*, 1925. He died June 3, 1947.

Hodgkin, THOMAS (1831-1913). British historian. Born in London, July 29, 1831, of Quaker parentage, Hodgkin was educated at London university and became partner in a bank at Newcastle-on-Tyne. By study he made himself an authority on the so-called Dark Ages. His greatest work is *Italy and her Invaders*, 1880-99; he also wrote *Theodoric the Goth*, 1891; *Life of Charles the Great*, 1897; and Vol. 1 of *Longman's Political History of England*, 1906. He died March 2, 1913.

A son, Robert Howard Hodgkin (b. 1877), was provost, 1937-46, of Queen's College, Oxford, of which he pub. a history, 1949, *Six Centuries of an Oxford College*,

and wrote a standard *History of the Anglo-Saxons*, 1935.

Hodgkin's Disease or **LYMPHADENOMA**. Disease characterised by gradual enlargement of the lymphatic glands throughout the body. The cause is unknown. Young men are most frequently affected. The glands in the neck are usually the first to become enlarged, and thereafter the condition slowly spreads to those in the armpit, groin, chest, and abdomen. Usually the spleen and liver are enlarged or altered. The patient gradually becomes anaemic, and the pressure of the enlarged glands upon the windpipe may cause difficulty in breathing, or pressure upon the oesophagus difficulty in swallowing. Pressure upon nerves may cause severe pain in various parts of the body. The heart may be displaced, and its action interfered with. Death generally occurs in from one to three years. Sometimes the disease remains stationary for prolonged periods. Complete recovery is rare, but it has been found empirically that certain patients recover who have been in contact with war gases of the mustard group. High protein diet and local application of X-rays are recommended as treatment.

Hodgkinson, EATON (1789-1861). A British mathematician. Born at Anderton, Cheshire, he worked on a farm. In 1811 he moved to Salford, where his aptitude for mathematics gained him admittance to a brilliant scientific circle. In 1822 his paper *On the Transverse Strains and Strength of Materials*, in which he fixed the position of the neutral line in sections of rupture and fracture, was read to the Literary and Philosophical Society of Manchester. To the same body he communicated the result of his studies in the strength of iron beams, which were eventually embodied in the Hodgkinson beam. He was consulted on many engineering problems, *e.g.* by Stephenson with regard to the construction of the Britannia Bridge. He died at Higher Broughton, Manchester, June 18, 1861.

Hodgson, RALPH (b. 1871). An English poet. A Yorkshireman, he worked as a journalist in London, becoming editor of *Fry's Magazine*; was appointed in 1924 lecturer in poetry at Tohoku university, Japan; and later resided in Ohio. His first book, *Last Blackbird* and other poems, appeared in 1907. His poetry is lyrical, direct, and vigorous in

e.g. The Song of Honour; inspired by love of animals in *The Bull*, tending to the sentimental in *The Bells of Heaven*. A popular poem is *Time, You Old Gipsy Man*. Hodgson won the Polignac prize and an award made by the National Institute of Arts and Letters, New York.

Hodgson, SHADWORTH HOLLWAY (1832–1912). British metaphysician. Born at Boston, Lincs, Dec. 25, 1832, he was educated at Rugby and Oxford. According to him, objectivity is nothing in itself beyond consciousness, but something belonging to consciousness. Existence is presence in consciousness. Physical happenings are not causes; but "real conditions" of psychical happenings. This view he declared to be identical with those put forward in the Platonic dialogue *Parmenides*—that the phenomenal world exists only in so far as it is the manifestation of the idea, that being and thought are the same. The most important of his works are *Time and Space*, 1865; *The Philosophy of Reflection*, 1878; *The Metaphysic of Experience*, 1898. Hodgson, who was president of the Aristotelian Society, died June 13, 1912.

Hódmező-Vásárhely. Town of Hungary, in the co. of Csongrad. It stands on Lake Hodos, near the right bank of the river Tisza (Theiss), from whose floods it is protected by dykes. Modern in appearance, the town has several imposing buildings, including a town hall, hospitals, and a gymnasium. It lies in a fertile agricultural district, and the township includes nearly 300 sq. m. of the surrounding territory. It is noted for a fine breed of horned cattle, and rears horses, sheep, and pigs. There are extensive vineyards in the locality, where choice white and red wines are produced. Cereals, chiefly wheat, oats, barley, maize, and millet, are grown, and brewing, oil refining, and the manufacture of tobacco are carried on. Pop. 61,736, mostly Magyars, two-thirds Protestants.

Hodograph (Gr. *hodos*, way, course; *graphein*, to describe). Curve of which the radius vector represents the magnitude and direction of a moving particle. If from any fixed point lines be drawn at every instant representing in magnitude and direction the velocity of a point describing any path in any manner, the extremities of these lines form a curve which is called the hodograph. It enables many problems of motion to be solved in a simple way.

Hodson, JAMES LANSDALE (b. 1891). British author and journalist. Born in Lancashire, Aug. 27, 1891, he joined the *Daily Mail* in 1913. After service in the First Great War, he rejoined that paper and became news editor of its northern edition, 1924–29. Later he was a special writer for the *News Chronicle*, *Sunday Times*, and *Allied Newspapers*. A war correspondent 1939–42, he worked on official films including *Desert Victory*, and *Tunisian Victory*. Hodgson wrote several novels, *e.g.* *God's in His Heaven*, 1935; *Carnival at Blackport*, 1937; *Jonathan North*, 1939; *English Family*, 1947; plays, including *Red Night*; *Harvest in the North*; and a book of travel, *Our Two Englands*.

Hodson, WILLIAM STEPHEN RAIKES (1821–58). British soldier. Born at Maisemore Court, near Gloucester, March 19, 1821, and educated at Rugby and Trinity College, Cambridge, he entered the army and proceeded in 1844 to India. Here he gained a unique reputation as adjutant, and eventually as commander of a corps of guides. In 1855, owing to confusion in the regimental accounts, he was removed from his command, but a second court of inquiry cleared his character.

During the Indian Mutiny, Hodgson did signal service as commander of a body of irregular cavalry, known as Hodgson's Horse, and as chief of the intelligence department. After the taking of Delhi, with only 50 men, he pursued and brought back the Mogul. On the following day, with 100 men, he tracked the princes of Delhi to the tomb where they had taken refuge. The princes surrendered, but as the mob seemed likely to attempt a rescue, Hodgson shot the princes one by one with his own hand; an act most adversely criticised. He died near Lucknow, March 12, 1858.

Hodza, MILAN (1878–1944). A Czecho-Slovak politician. Born a subject of the Dual Monarchy, the son of a pastor, he studied law at Budapest and Vienna university, and was elected as a Slovak to the Hungarian parliament in 1905. He was appointed Czecho-Slovak minister to Hungary in 1918 and prime minister of his country in 1935. Advocating co-operation between all the racial elements, but granting autonomy to Ruthenia, he resisted German claims for the cession of the Sudetenland; but on Sept. 20, 1938, he resigned, foreseeing the Munich agreement, whereupon he

retired to Switzerland. Hodza joined the Czecho-Slovak state council in London as vice-president in 1940, but soon resigned. He was in Florida when he died, June 27, 1944.

Hoe. Instrument for breaking up the ground. The hand hoe is best made with a neck curved like

Hoe. Common forms of this garden implement. 1. Half moon. 2. 8-in. steel. 3. Onion hoe with handle. 4. Dutch hoe

that of a swan; the horse-hoe, or grubber, for cultivation between the rows of roots or cereals, may be either a small three-shared machine that can be drawn by one horse, or a larger contrivance with as many as ten tines. The uses of the hoe are to remove weeds, to break up winter cap, and to produce a surface mulch by which the undue evaporation of moisture is prevented. See *Agriculture*; *Egypt*.

Hoe, RICHARD MARCH (1812–86). American inventor. Born at New York, Sept. 12, 1812, son of

an English emigrant who invented the Hoe printing press, he became a partner in his father's business. He and his two brothers became managers of the firm in 1841, and five years later produced a rotary press, the first of its kind, named Hoe's Lightning Press. An improvement appeared in 1871, which printed on both sides of the paper, which it cut and folded. Hoe died at Florence, June 7, 1886. See *Printing*.

Hoenir. One of the three gods in Norse mythology, the long-legged one, the lord of the ooze, synonymous with stork. After

Midgard, the abode of mankind, was formed, Odin, Hoenir, and Lodur made man and woman from an ash and an elm, Hoenir's gift being speech. He is said to have first used the divining rod for revealing hidden waters.

Hoerbiger, HANS (1860-1931). Austrian physicist, born in Vienna Nov. 29, 1860. After having been successful as inventor and technician, he elaborated in Welteislehre (Glacial Cosmogony) a theory ascribing the creation and development of celestial bodies to the agglomeration of ice and the reciprocal influence of ice and sun. Much discussed in 1912-14, his teachings were rejected by most astronomers, but continue to exercise some influence.

Hoesch, LEOPOLD VON (1881-1936). German diplomatist. Born June 10, 1881, at Dresden, he came of a family of Ruhr industrialists. After studying law he entered the foreign office in 1907, and served before the First Great War in Peking (Peiping), Paris, Madrid, and London. As chargé d'affaires at Paris, in 1924 he was promoted to ambassador. A sincere advocate of cooperation, he successfully represented the Stresemann-Briand policy. After the death of these statesmen he applied for transfer to London, where as ambassador from Sept., 1932, until his sudden death on April 10, 1936, he won high esteem while incurring the dislike of the Nazi government.

Hoetzsch, Otto (1876-1946). German historian and politician. Born Feb. 14, 1876, at Leipzig, he became professor at the Posen (Poznan) academy in 1906 and at Berlin in 1920. In the Reichstag, 1919-30, he was a moderate Conservative, leaving his party when its leader Hugenberg began plotting with Hitler. A member of German delegations to Geneva, 1927-30, he approved of the policy of conciliation. He was an authority on Russia, writing popular books on that country and other subjects of contemporary history. Suspected of participation in the July plot of 1944, he suffered persecution by the Nazis, dying Aug. 30, 1946.

Hof. German town, in Bavaria, 30 m. N.N.E. of Baireuth and near the Czech frontier. It is a rly. junction and before the Second Great War was an airport. An industrial centre, it makes textiles, carpets, machinery, china, and preserved foods. Hof became in 1323 the property of the Hohenzollern burgraves; in 1792 fell to

Prussia; in 1810 became Bavarian. Though largely destroyed by fire in 1823, it has three old churches and a Rathaus dating from 1563. Pop. 43,545.

Hofer, ANDREAS (1767-1810). Tirolese patriot. Born at St. Leonard in the Passeier valley, Tirol, Nov. 22, 1767, he inherited his father's business as an innkeeper. In 1797 he enlisted a body of sharpshooters to drive the French from the neighbourhood of Lake Garda, and in 1805 he led his troops against Ney. By the treaty of Pressburg, 1805, Tirol passed into the power of France and was joined to Bavaria, but Hofer led a secret agitation in favour of annexation to Austria. On the outbreak of war between that country and France in 1809, he defeated the Bavarians at Sterzing and Innsbruck, and drove them from Tirol. Lefebvre's army, sent by Napoleon to stamp out this insurrection, was beaten at Berg Isel, but by the terms of the treaty of Schönbrunn Austria abandoned the country to the French, who captured Hofer, took him to Mantua, and there shot him, Feb. 20, 1810.

Höfding, HARALD (1843-1931). Danish author and philosopher. Born in Copenhagen, March 11, 1843, he published German Philosophy after Hegel in 1872, followed by Contemporary English Philosophy, 1874; The Foundation of Ethics, 1876; Charles Darwin, 1889; The Ethics of John Stuart Mill, 1909; and Henri Bergson's Philosophy, 1914. There are Eng. trans. of his History of Modern Philosophy, 1900; Brief History of Modern Philosophy, 1912; and Modern Philosophy and Lectures on Bergson, 1915. He died July 2, 1931.

Hoffmann, AUGUST HEINRICH (1798-1874). German poet and scholar. He was born April 2, 1798, at Fallersleben, in Lüneberg, and is hence sometimes known as Hoffmann von Fallersleben. He was librarian at Breslau university, 1823-38, and professor there, 1835-42. The publication of his Unpolitische Lieder (Unpolitical songs), 1841-42, caused his dismissal. He produced Deutschland über Alles, 1841, which took the position of the national anthem of the German Empire. Versatile and prolific in lyrics inspired by love, wine, patriotism, and good fellowship, he enjoyed a great vogue as a poet. He wrote much on early German literature, hymnology, and philology. Died at Corvei, Jan. 19, 1874.

Hoffmann, ERNST THEODOR AMADEUS (1776-1822). German author. Born at Königsberg, Jan. 24, 1776, he studied law, but

E. T. A. Hoffmann,
German author

spent much time wandering about Germany, supporting himself by writing and portrait painting, composing, and managing provincial theatres. In 1816 he became chancellor of the court of appeal at Berlin, and about this time adopted the name of Amadeus in place of his baptismal Wilhelm, in honour of Mozart, to whom he was devoted. The short stories and essays he had published in 1814-15 in Phantasiestücke had been well received, and then a gruesome novel, Die Elixiere des Teufels, made him famous. Nachtstücke, 1817, and Die Serapionsbrüder, 1819-21, contain short stories which occupy a prominent place in romantic literature. Hoffmann died June 25, 1822.

Extraordinarily prolific, Hoffmann composed, painted, and wrote with equal grace, and became the centre of a large circle of musical and literary talent. His influence on the work of Schumann was especially marked. Of his own operas, Undine, 1816, is best known. Offenbach's opera, Tales of Hoffmann, is based on this writer's work.

Hoffmann's Anodyne. Compound spirit of ether, first made by Frederick Hoffmann in the middle of the 18th century. The inventor claimed that his preparation was composed of the dulcified spirit of vitriol (ether) and the aromatic oil which came over after it. He did not state in what proportions he mixed these ingredients. Compound spirit of ether was formerly used as a remedy for gastric flatulence.

Hoffmann, AUGUST WILHELM (1818-92). German chemist, born at Giessen, April 8, 1818. He studied chemistry under Liebig in his native town.

In 1845 he was appointed superintendent of the Royal College of Chemistry, London, afterwards incorporated in the Imperial College of Science

A. W. Hoffmann,
German chemist

From 1865 he was professor of chemistry in Berlin, until his death, May 5, 1892.

To him is due the discovery of the composition of rosaniline, which was of great technical importance in the early days of the coal-tar colour industry. He discovered a beautiful aniline dye known as Hofmann violet; also allyl alcohol and formaldehyde. The reaction for converting an amide into an amine having one carbon atom less is named after this chemist. After he returned to Germany he founded (1868) a chemical society on the model of the London society.

Hofmannsthal, **HUGO** VON (1874-1929). Austrian poet and librettist. Born in Vienna, Feb. 1, 1874, he was educated at the university there, having published a collection of poems while still a schoolboy. Influenced by Stefan Georg, he founded a romantic school of poetry. His plays, based chiefly on the works of earlier romantics, included *Der Tor und der Tod* (The Fool and Death), 1893; *Oedipus und die Sphinx*, 1906; but he is best known as the librettist for Strauss's operas *Elektra*, *Der Rosenkavalier*, and *Ariadne auf Naxos*. His correspondence with Strauss, trans. P. England, appeared in 1929. He died July 15 that year.

Hofuf. Town of Saudi Arabia, the capital of Hasa. It is situated about 40 m. inland from Ukair on the Persian Gulf, and is on the Pilgrim's Road through Nejd to Mecca. It is one of the urban centres (Mubarraz being the other) in the great oasis in the S. of Hasa. Pop. 20,000.

Hogarth, **DAVID GEORGE** (1862-1927). British archaeologist. Born at Barton-on-Humber, May 23, 1862, he was educated at Winchester and Magdalen College, Oxford. He carried out explorations in Asia Minor, 1887-94, and excavations in Crete, Egypt, Ephesus, Assiut, and Carchemish. He was director of the British school at Athens, 1897-1900, and succeeded Sir Arthur Evans as keeper of the Ashmolean Museum in 1909. As director of the Arab Bureau he delivered in 1918 to King Hussein of the Hejaz the Hogarth message, in which Great Britain stated that the Palestine problem should be solved by Arab and Jewish co-operation. His works include *Modern and Ancient Roads in E. Asia Minor*, 1892; *The Nearer East*, 1902; *The Archaic Artemisia of Ephesus*, 1908; *Ionia and the East*, 1909; *The Ancient East*,

1914; *Arabia*, 1922. He died Nov. 6, 1927.

Hogarth, **WILLIAM** (1697-1764). English painter, engraver, and moralist. Belonging to a Westmorland family, he was born in Bartholomew Close, London, Nov. 10, 1697. He began his career as apprentice to a silversmith in Leicester Fields, but amused himself with painting, and paid some attention to engraving. His master set him to engrave visiting cards, shop bills, and coats of arms, but he himself worked on illustrations for books, and soon produced six for King's History of the Hea-

Wm Hogarth
Self-portrait in the National Gallery

then Gods. In 1726 he became known by some plates for Butler's *Hudibras*. Three years later, running away with the only daughter of the artist Sir James Thornhill, he settled in South Lambeth.

His well-known trip to the Isle of Sheppey took place in 1732. He was one of a party of four, and to the account of the journey and its adventures Hogarth supplied the illustrations. The MS. can still be seen in the British Museum. Then he removed to Leicester Fields, and began, with *The Harlot's Progress*, his long series of didactic chronicles in pictorial art. This group of works includes *The Rake's Progress*, *The Enraged Musician*, the wonderful series of *Marriage à la Mode*, *Beer Street* and *Gin Lane*, *Industry and Idleness*, *Four Stages of Cruelty*, and *The Election*.

His popular portraits and interiors belong to quite another order. They possess a charm of composition, colouring, and lively atmosphere entirely their own, which can never be too highly praised. They are works of the highest

artistic merit, as portraits unflinching, as works of decoration charming; indeed as a portrait painter, especially when those of Lord Lovat, Capt. Coram, the artist himself, and Garrick are considered, Hogarth has had few rivals. His composite portrait of his own servants and his famous *Shrimp Girl*, both in the National Gallery, London, rank among the world's most precious canvases. Equally does he stand alone in his extraordinary moral chronicles, vivid pictures of the evil side of English life of the day, social and domestic vices, attacked at their most vulnerable points by ridicule. He waged a strong crusade against criminality, corruption, hypocrisy, and extravagance, and perhaps a stronger against drunkenness and cruelty to animals.

Hogarth became serjeant painter to the king in 1757. In 1762 he allowed his satirical genius to take political form and the result was a savage portrait of Wilkes and a quarrel with his former friend. Hogarth was in the habit of spending all the summer at Chiswick and the winter at his house in Leicester Fields, where he died Oct. 26, 1764. He was buried at Chiswick.

Several of his best pictures are at the Soane Museum in Lincoln's Inn Fields; others, including his great portrait of Coram, its founder, are at the old Foundling Hospital, Bloomsbury, while others are at S. Bartholomew's Hospital, the National Gallery, the National Portrait Gallery, Windsor Castle, and Lambeth Palace. His house at Chiswick was presented to the Middlesex county council in trust for the public. See Art; Caricature; Cockfighting illus.

Hogg, **JAMES** (1770-1835). Scottish poet, known as the Ettrick Shepherd. Born at Ettrick, Selkirkshire, the son of a shepherd, he received a scanty education, but at 16 a reading of *The Gentle Shepherd* by Allan Ramsay inspired him to write poetry. This leaning

James Hogg

was developed by his connexion with Scott, to whom he supplied some old ballads for his *Border Minstrelsy*. Hogg did not obtain any success until 1807, when a volume of poems entitled *The Mountain Bard*, and a practical treatise on the care of sheep, brought him in £300, which he lost in unprofitable farming.

The Queen's Wake, 1813, a series of ballads supposed to have been recited before Mary Queen of Scots at a competition of Scottish bards, was the first work to bring Hogg something more than a local reputation. It has real merit, with a strong vein of impressive if somewhat fantastic imagination. The latter half of Hogg's life was spent partly in Edinburgh and partly at Altrive in Yarrow on a farm of which the duke of Buccleuch gave him a life lease, and where he died Nov. 21, 1835. Hogg was a prolific writer both in verse and in prose. Among his best known poems are *The Poetic Mirror*, *Bonny Kilmeny*, and some fine lyrics such as *To the Skylark*, *When the Kye comes Hame*, and *Cam' ye by Atholl?* *Memorials of J. H.*, by M. G. Garden, appeared in 1903; a critical study by E. Batho, in 1927.

Hogg, Quintin (1845-1903). British philanthropist. The fourteenth child of Sir James Weir

Quintin Hogg.
British philanthropist
Elliott & Fry

Hogg, he was born in London, Feb. 14, 1845, educated at Eton, and became a merchant in the City. In 1882 he purchased the lease of the Royal Polytechnic Institution, Regent St., which he

opened on Sept. 25 as a successor to an earlier Youths' Christian Institute, his object being to provide young men with instruction and recreation. Hogg died at the Polytechnic, Jan. 17, 1903. His *Life* was written by E. M. Hogg, 1904. A statue, originally outside the Polytechnic (*q.v.*), now stands in Portland Place, W.1.

Hogg's son Douglas, who became Viscount Hailsham, is noticed under that title. The latter's son, another Quintin Hogg (b. 1907), became a barrister, was M.P. for Oxford city from 1938, and a trenchant Conservative publicist and broadcaster.

Hoggar or **Ahagggar**. High plateau region of the Sahara, lying S. of Algeria. The mountains,

though not exceeding 8,000 ft., are a barrier to a projected Trans-Sahara rly. To the N. lies Ain Salah, occupied by the French in 1899. *See Sahara*.

Hogland or **Hochland**. Island of Finland. It is in the govt. of Viborg (Viipuri), in the Gulf of Finland, and was at one time joined to the mainland. It is known for a vibrating rock, which produces the sounds of an organ.

Hogmanay or **CAKE DAY**. Name used in Scotland and the N. of England for New Year's Eve, and the gifts then bestowed. Among hogmanay customs are the exchanging of presents between friends, the giving of oatcakes to children to the cry of "hogmanay," and the singing and acting of the guisers or masquers. In London, Scotsmen celebrate hogmanay night in S. Paul's Churchyard. Though first recorded in Scotland in the 17th century the word, variously spelt hogmena, hogmenay, hagman heigh, is probably of early French origin, and a corruption of O. Fr. *aguillanneuf*, explained as "to the mistletoe the new year" (*au gui l'an neuf*), a term of rejoicing derived from the Druids.

Quintin Hogg. Statue in Portland Place, London, erected by members of the Regent Street Polytechnic in memory of its founder

Hog Plum (*Spondias*). Genus of trees of the family Anacardiaceae, natives of the tropics of both hemispheres. The leaves are divided into long, opposite leaflets, and the flowers are small with four or five each of sepals and petals. The fleshy fruit is plum-like and contains four or five seeds. These fruits vary in

Hog Plum. Leaf, flowers, and fruit of *Spondias dulcis*

flavour, according to species; some, though palatable to natives, are not appreciated by strangers. *S. lutea*, native of the West Indies, is known as golden apple and Jamaica plum. *S. dulcis*, of the Society Islands, is the sweet Otaheite apple, with a pine-apple-like flavour. The unripe fruits of *S. mangifera* are used as a pickle in India.

Hog's Back. Western termination of the North Downs in Surrey, England. It is so called on account of its outline. It runs from Guildford to Farnham, about 10 m.; the height of the chalk elevation is from 350 to 500 ft., and its breadth at the top is about 500 yds. *See Downs*.

Hogshead. Old English measure of liquid capacity. In 1483 it was fixed at 63 wine galls., equal to 52½ imperial galls., but now it equals 54 galls. for beer, cider, etc. As a large cask, its capacity varies according to commodity and locality, as for molasses, sugar, or tobacco. *See Weights and Measures*.

Hog's Stomach. Extracts are used in cases of dyspepsia due to shortage of the normal secretions of gastric digestion. Also in pernicious anaemia, to replace the blood-making factor normally secreted by the stomach wall. *See Anaemia*.

Hohenberg, SOPHIE, DUCHESS OF (1868-1914). Austrian princess. Born the Bohemian Countess Chotek, she married the Archduke Francis Ferdinand of Austria in 1900. The alliance was morganatic and their children, therefore, forfeited the right of succession to the Austro-Hungarian imperial throne. The duchess was driving with her husband when he was assassinated at Serajevo, June 28, 1914, and she shared his fate.

Hohenfriedberg, BATTLE OF. Prussian victory over the allied Austrians and Saxons in the War of the Austrian Succession on

June 3, 1745. Frederick the Great, whose army of 65,000 was opposed to the Allied forces of Prince Charles of Lorraine, 70,000 strong, had been watching the advance of his enemy upon Silesia, and had kept his army concealed. Seizing an opportunity of striking, during the night he manoeuvred his men and guns, and at daybreak opened a furious attack on the enemy left wing. After two hours of fighting the battle became general, and despite a stiff resistance on the part of the Austrians, an irresistible charge of the Baireuth dragoons finished the battle with the capture of 2,000 prisoners and 66 Austrian colours.

Hohenlinden, THE BATTLE OF. French victory over the Austrians, Dec. 3, 1800. The Austrian archduke John, in order to cut off the French army under Moreau, who had established himself N. of the Inn, resolved to cross the Lower Inn and seize Munich. Hampered by bad weather, the Austrians were advancing through the driving snow when Moreau launched an attack against them. Ney and Grouchy engaged the van, while Richepanse skilfully attacked the rear, and, thus caught between two shears, the Austrian defence gave way. They lost heavily, 10,000 casualties, and as many prisoners, together with a hundred guns. The French losses were little more than 5,000. Thomas Campbell has a poem on the event.

Hohenlohe. Former principality of Germany, consisting mainly of the Jagst-Kreis of Württemberg. It lies to the E. of Heilbronn on the Bavarian frontier, and was mediatised in 1807. The family of Hohenlohe, which traces its descent from the 12th century, was divided in 1551 into two lines, Hohenlohe-Neuenstein, and Hohenlohe-Waldenburg, and has produced several soldiers and statesmen, two of whom are mentioned immediately below.

Hohenlohe - Ingelfingen, FRIEDRICH LUDWIG, PRINCE OF (1746-1818). Prussian general. Born at Ingelfingen, Württemberg, Jan. 31, 1746, he saw service against the Prussians during the Seven Years' War. After this he entered the Prussian army, rising to high command by 1794, when he beat the French at Kaiserslautern as a corps commander. In 1806, however, he was defeated by Napoleon at Jena (Oct. 14), and, despite personal gallantry, was forced to surrender at Prenzlau with 17,000 men on Oct. 28. Died near Kosel, Silesia, Feb. 15, 1818.

Hohenlohe - Schillingsfürst, CHEROLDWIG KARL VICTOR, PRINCE OF (1819-1901). German states-

man. Born at Rotenburg, on the Fulda, in Hesse, March 31, 1819, of the junior branch of the family, he entered the diplomatic service after some years as a Prussian civil servant. During 1866-70 he was Bavarian minister for foreign affairs and head of the government, in which latter capacity he played an important part in assisting Bismarck to bring about the union of N. and S. Germany. In 1874 he went as German ambassador to Paris, and was one of Germany's representatives at the Berlin congress of 1878. From 1885 he was governor of Alsace-Lorraine, leaving Strasbourg in 1894 to take the post of imperial chancellor. Most of his work as chancellor was done behind the scenes, but he was a continual supporter of Bismarck's policy, and remained the emperor's chief adviser until Oct., 1900. He died at Ragatz, Switzerland, July 6, 1901. The publication of his Memoirs in 1906 caused a sensation by their candour. See Berlin, Congress of; consult Memoirs, Eng. trans. G. W. Chrystal, 1906.

Hohenstaufen. Name of a famous German family, members of which were rulers of the medieval empire during 1138-1254. The name is taken from a hill near Lorsch, in Württemberg, on which the early Hohenstaufens had their castle, some remains of which are still in existence.

The family first became prominent in the 11th century, towards the end of which one of them was made duke of Swabia. This gave them an added importance in Germany, especially in the time when Henry V was emperor. Frederick and Conrad of Hohenstaufen were his nephews, and when he died, in 1125, Frederick, his heir, just failed to secure the throne. In 1127, however, Conrad was chosen German king, and in 1138 became the emperor Conrad III. Frederick I Barbarossa succeeded him in 1152, and then came Henry VI in 1190. After a period of decline the position of the Hohenstaufens was restored by Frederick II, but when his grandson Conradin was put to death in 1268 the male line

became extinct. See Empire; Frederick I; Frederick II.

Hohenzollern. Name of the family that supplied kings to Prussia from 1701 to 1918 and German emperors from 1871 to 1918; also of a principality, later a Prussian prov., in S. Germany. The family was first heard of in S. Germany, its earliest members being nobles who called themselves counts of Zollern, the hill on which their castle stood. This is near Hechingen, about 30 m. S. of Stuttgart, and was known as Hohen or High Zollern. The castle, of which some ruins remain, is said to have been built in the 9th century, but the first authoritative mention of its counts is in the 11th. The existing castle on the hill was built by Frederick William IV (1795-1861).

Frederick was always a favourite name in this family, and in the 12th century two Fredericks, father and son, were very useful to the German kings of their time. A third Frederick increased the importance of the family by a marriage which made him in 1191 burgrave of Nuremberg.

In 1227 the family lands were divided, and two main branches of the Hohenzollerns came into existence. The elder kept Zollern and the lands there, and was known as the Swabian; the younger supplied burgraves to Nuremberg, and, as that city was in Franconia, was known as the Franconian. The Franconian Hohenzollerns were the more ambitious. One Frederick, burgrave of Nuremberg, obtained the principality of Baireuth, and in 1273 helped Rudolph of Hapsburg to secure the throne so long held by his descendants. His son, another Frederick, obtained Ansbach, and rendered invaluable service to Louis IV. A later Frederick was made a prince of the empire in 1363.

In 1415 the European importance of the Hohenzollerns began. Brandenburg was without a ruler, and the emperor Sigismund gave it to his friend, Frederick of Hohenzollern, who became its margrave and one of the seven electors. This shifted the power of the Hohenzollerns from S. to N. Germany, and henceforward they were identified closely with Brandenburg. Under their rule its area and wealth were increased, the most vigorous of them being perhaps

Prince Hohenlohe-Schillingsfürst, German statesman

Hohenzollern province arms

the great elector Frederick William, under whom it became a European power. In 1701 his son Frederick became king of Prussia, and this title superseded the earlier one. The family reached the summit of its greatness when William I was crowned German emperor in 1871. Ansbach and Baireuth served meanwhile as inheritances for younger sons until in 1791 they were sold to the king of Prussia.

All this time the Swabian Hohenzollerns continued to lose their lands in comparative obscurity. The emperor Charles V befriended them, and they soon formed the lines Hohenzollern-Hechingen and Hohenzollern-Sigmaringen. Both rulers were princes of the empire and maintained their little courts until 1849. Then they resigned their thrones and their territories became the property of the king of Prussia, according to an arrangement made in 1895. The land was formed into the co. or dist. of Hohenzollern, and was part of Prussia until 1945, when it was allotted to the French zone in Germany. These Swabian Hohenzollerns took their places as younger members of the house. One of them, Leopold, was suggested as king of Spain in 1870, and another, Charles, became king of Rumania in 1881. The revolution of 1918 reduced all the Hohenzollerns, except the king of Rumania, to the position of private individuals. See Germany; Prussia; consult My Ancestors, William II, Eng. trans. W. W. Zambra, 1929; The Hohenzollerns, H. Eulenberg, Eng. trans. M. Bozman, 1929.

Hohenzollern-Redoubt. Name given to an intricate trench fortress in the German first line at the battle of Loos, 1915. It lay about 4½ m. N. of the village of Loos, in the dept. of Pas-de-Calais. It was pear-shaped, with its broad end pointing N., and had a frontage of 500 yds. See Loos, Battle of.

Hohe Tauern. Range of mts. in the Austrian Tirol. It trends from W. to E., to the S. of Salzburg, between the Pinzgau and the Puster Thal. The highest peaks are the Gross Glockner (12,455 ft.) and the Gross Venediger (12,000 ft.). The range, which is continued W. by the Zillerthal Alps and E. by the Niedere Tauern, is crossed by no road, but the rly. from Salzburg to Carinthia passes it by a series of tunnels.

Hoihow. Seaport of Kiungchow, and capital of the Chinese administrative district of Kiungchow, which comprises Hainan Island, off the S. coast of China.

It is a walled town which owes its importance to the opening of Kiungchow as a treaty port. Here are foreign consulates and the customs station. The name means seaport.

Hokiang. One of the nine north-eastern provinces of China. The name means meeting of the rivers (Sungari, Ussuri, and Heilungkiang). Area, 50,816 sq. m. There are 18 counties, with Kiamusze as the capital. Hokiang lies in a low humid plain. It is thinly populated largely because of wide marshlands and difficulties in cultivation and drainage. The winter is extremely cold with long periods of heavy frost. Pop. 1,298,000.

Hokitika. Borough and political capital of Westland, New Zealand. Situated on the Hokitika river, it has rly. connexion with Greymouth and Ross. Gold mining (sluicing and dredging), sawmilling, and farming are the chief support of town and district. Hokitika means direct return. The celebrated Franz Josef glacier, 95 m. S., the Fox glacier, Mahinapua lake and river, and Lake Kanieri are easily accessible, and the scenery surrounding the last is among the finest in New Zealand. Pop. 2,730.

Hokkaido. Term applied to a northern section of Japan which includes Yezo and the Kurile Islands (*g.v.*). Yezo, to which the name Hokkaido is frequently loosely applied, has an area, with adjacent islands, of 34,276 sq. m., and is separated from Sakhalin (Karafuto) by Soya Strait, and from Honshu, the Japanese mainland, by Tsugaru Strait.

In general the shape of Yezo is due to the lie of the mountain ranges of the interior, for the land usually rises somewhat rapidly from the coast. The central block of mountains, with many peaks above a mile high, culminates in Wutakkamushpa (7,300 ft.); from it ridges radiate to N., W., and S.; W. of the W. and S. ridges lie the valleys of the two largest rivers, Teshio and Ishikari, with a coastal ridge beyond. W. and S. of Sapporo ridges form a backbone as far as Hakodate, the highest point being Makkarinupuri (6,500 ft.), a graceful tree-clad cone, with a crater 2 m. in circumference. Tarumae, E. of Makkarinupuri, is an active volcano, and the majority of the peaks are extinct craters; between Tarumae and Mororan is the hot spring and geyser district of Noboribetsu.

The main rly. line is from Hakodate to Nemuro through Otaru, Sapporo, and Asahigawa; there are branches to the coast at Iwanai, Mororan, Rumoi, Abashiri, and Soya Strait. Nemuro is the port for the Kuriles. Ferry services are maintained from Hakodate and Mororan to Aomori in Honshu; the main steamship service is from Otaru and Hakodate to Kobe. Sapporo, a new town laid out in 1869, is the capital, and Hakodate the chief port; Otaru and Mororan export coal. Mororan has a steel foundry, but fishing, lumbering, and mining are the principal industries.

Tsugaru Strait is a deep channel which separates the flora and fauna of Yezo from those of Honshu; the grizzly bear of Yezo is not found in Honshu, while the red pine of Honshu does not occur in Yezo. The Yezo climate is severe: winter is long, much snow falls and lies on the ground for six months, and the shores are icebound for a long period. There is little agriculture as the soil is unsuitable, but farming in a small way is carried on. Salmon is canned at Ishikari, and brewing is engaged in at Sapporo, where there are paper mills and glass works. The chief exports normally are canned salmon, dried fish roe, salt, sulphur, and fish oil. Pop. 2,000,000, including about 20,000 Ainu. See Japan.

Hokusai, KATSUSHUKA (1760-1849). Japanese painter. Born at Yeddo, Oct. 21, 1760, he studied under the elder Shonsho, whose popular style he closely followed at first. He is known as the creator of popular Japanese genre, landscapes, flower paintings, etc. His output was enormous, his *kakemonos* have been eagerly sought by Western connoisseurs, and his influence on Degas and Whistler was marked, though his own countrymen have never regarded him as an artist of the first rank. He died at Yeddo, May 10, 1849.

Holbach, PAUL HEINRICH DIETRICH, BARON D' (1723-89). French materialistic philosopher. Born at Hildesheim in the Palatinate, he was brought up in Paris. Here he gathered round him distinguished men and philosophers—d'Alembert, Helvétius, Diderot, Grimm, Buffon, Hume, Sterne, Rousseau. His ideal was entire political and religious liberty. His *System of Nature*, the bible of materialism, published under the pseudonym of Mirabaud, disturbed by its outspoken-

ness even Frederick the Great and Voltaire, and terrified Goethe. According to Holbach, mind and matter, morality and natural philosophy, are identical; matter and movement, its inseparable companion, alone exist. All religions are equally harmful and unnecessary. Holbach died in Paris, Jan. 21, 1789. *Pron.* Oibak.

Holbeach. Market town in Lincolnshire, England, and agricultural centre noted for potatoes, flowers, and bulbs. It is 8 m. by railway E. of Spalding. All Saints' Church is a fine example of Late Decorated. On Holbeach Fen extensive traces of Romano-British occupation have been studied by air photography and excavation. Holbeach Marsh, between the town and the Wash, has been reclaimed from the sea by successive enclosures. Market day, Thurs. Pop. 6,112.

Holbein, HANS (c. 1460-1524). German painter. Born probably at Augsburg, a tanner's son, he was influenced by, and possibly studied under, Martin Schongauer at Colmar. Until 1514 his home was Augsburg, but he was at Ulm in 1499 and Frankfurt in 1501, and died at Issenheim. He painted some altar-pieces and panels for churches in Central and S. Ger-

Holbein, HANS (c. 1497-1543). German painter and engraver. Born at Augsburg, he was the son of Hans Holbein the elder, and brother of Ambrose and Sigmund Holbein, also painters, the former specially known as a designer for work in wood engraving. When the

home at Augsburg was broken up in 1514, Hans went to Basel, where he employed himself in preparing designs for title pages and illustrations for the great printing firms. His earliest surviving painting, representing the Virgin and Child, was executed in the same year. In 1517 he carried out some wall decoration at Lucerne, but was back again in Basel in 1521, to which year belongs his decoration of the Rathaus. His two greatest religious pictures, each of them representing the Madonna and Child, belong to 1522 and 1526. The former is at Solothurn; the latter, now at Darmstadt, is one of his grandest compositions.

Hans Holbein,
German painter
After a self-portrait

for whom at once he became principal painter. To this same period belongs the portion of the cartoon for the decoration of the Palace of Whitehall, now preserved as one of the principal treasures of the duke of Devonshire. Holbein's great portrait of Christina, duchess of Milan, now in the National Gallery, was painted in 1538, and soon after its completion he was back for the last time in Basel. In 1539 he was sent abroad to paint the portrait of Anne of Cleves. Returning again to England, he resided in the parish of S. Andrew Undershaft, London, where, according to his will, discovered in 1861, he died, probably of the plague, about Oct., 1543.

Holbein was a marvellous draughtsman, and his designs for woodcuts, and for decoration, and for objects to be executed by the goldsmith, are of the greatest possible beauty. In portraiture, he excels in simplicity and in accuracy. The famous series of portrait drawings preserved at Windsor Castle, and representing the chief persons connected with the court of Henry VIII, are unequalled for the extraordinary simplicity with which they present fidelity to character. They are perhaps the simplest and most truthful portraits ever executed, and done with a rigid economy of line.

Holbein first came to England in 1526, bearing letters of introduction to Sir Thomas More, who received him with great consideration, and entertained him at his house. He made sketches and studies for the important group representing More and his family, which appears to be no longer in existence. Two years later he was back again in Basel, and there carried out some important commissions. He remained there until 1531, when he settled near the London Steelyard. One of the greatest

portraits of this period was that of Thomas Cromwell, and it was probably the then Master of the Jewel House who presented Holbein to Henry VIII,

for whom at once he became principal painter. To this same period belongs the portion of the cartoon for the decoration of the Palace of Whitehall, now preserved as one of the principal treasures of the duke of Devonshire. Holbein's great portrait of Christina, duchess of Milan, now in the National Gallery, was painted in 1538, and soon after its completion he was back for the last time in Basel. 2 secs.; in 1890 he covered 177½ m. in 12 hrs. In 1892 he accomplished 337 m. on a tricycle in 24 hrs. He became equally famous as a long distance swimmer, principally in connexion with his nine unsuccessful attempts to swim the Channel between 1903 and 1911. Holboin died July 11, 1944.

Holberg, LUDVIG, BARON AF (1684-1754). Danish writer. Born at Bergen, Norway, Dec. 3, 1684,

Ludvig Holberg,
Danish writer

he was educated there and at Copenhagen university. He travelled widely in Germany, Holland, and Scandinavia, and in 1706-07 was at Oxford, where he supported himself by teaching music. On returning to Copenhagen, he became an honorary professor, but set out travelling again, visiting Paris and Rome. He came back in 1746, and

two years later became professor of metaphysics, and, in 1720, of public eloquence. In 1719 a new chapter of his varied life opened with the publication of the famous mock-heroic poem, *Peder Paars*, a brilliant satire on the pedantries and conventions of his day, and he went on to devote his energies to the drama. He directed the newly

founded Danish theatre at Copenhagen, 1722-27, producing in rapid succession a number of comedies, which have earned for him the title of the Molière of Denmark.

The third phase of Holberg's life was spent on historical, biographical, and philosophical works, marked by their good style no less than by the extraordinary versatility of their author. In recognition of his invaluable services to Danish vernacular literature, of which he is generally counted as the founder, French and Latin being used before he was created baron in 1747. His activity continued almost to his death, Jan. 28, 1754. Grieg, who greatly admired Holberg, named a suite after him. *See* Denmark; Literature; consult Life, G. Brandes, 1884.

Holborn. Municipal borough of London. It covers 405 acres, extending from Tottenham Court

Holborn borough
arms

Rd. on the W. to Farringdon Rd. on the E., mainly N. of New Oxford St. and High Holborn. Near Staple Inn there stood until 1867 Holborn Bars, indicating the W. boundary of the City. The main road was part of the old way of those going to execution from the Tower and Newgate to Tyburn. Holborn was a centre of disturbance and suffered considerable damage in the Gordon Riots of 1780.

The district contains the British Museum; Gray's Inn, Lincoln's Inn, and Staple Inn; the churches of S. Alban (1858), S. Giles-in-the-Fields (1731-33), and the 14th century chapel of S. Etheldreda; and the Hospital for Sick Children. All these buildings suffered from bombing, blast, or fire during the

premises, a rly. terminus and a large underground rly. junction. Holborn had as its first mayor in 1900 the 11th duke of Bedford. It joins with St. Pancras S. to elect one M.P. Pop. 38,816.

Holborn Viaduct, 1,400 ft. long and 80 ft. wide, including an iron bridge of 107 ft., was constructed in 1867-69, at a cost of £1,571,000, to carry the roadway over the valley of the Holebourne, part of the Fleet (*q.v.*), whence Holborn derives its name. On the viaduct stood the City Temple (*q.v.*).

Holbrooke, JOSEF CHARLES (b. 1878). British composer. Born July 5, 1878, he studied at the Royal Academy of Music, and obtained engagements as a conductor and concert pianist, but composition was his primary interest. His tone-poem, *The Raven*, after Poe, performed at the Crystal Palace in 1900, arrested attention; other tone-poems for chorus and orchestra followed, *Queen Mab*, *Ulalume*, *The Bells*, *Apollo and the Seaman*. A two-act opera, *Pierrot and Pierrette*, was given in 1909. Then came the Wagner-like trilogy, *The Cauldron of Anwyn*, to a libretto by Lord Howard de Walden; of the three works composing it, *The Children of Don* was first performed in 1912; *Dylan* in 1914; of *Bronwen*, extracts have been played. Holbrooke wrote eight symphonies, eight concertos, including one for saxophone and bassoon, three sets of variations on popular tunes, operas, and chamber music. His work is conceived on a heroic scale, and he employs an unorthodox orchestra.

Holborn. Upper picture: Tudor houses in High Holborn, which screen the view of Staple Inn. The figure of a soldier, here seen in the foreground surmounts the memorial to members of the Royal Fusiliers (City of London Regiment) who fell in the First and Second Great Wars. Lower picture, Holborn Viaduct, which spans Farringdon Street, and which was erected 1867-69

German air raids of 1940-45, when over 250 bombs and 2,500 incendiaries fell on Holborn. Also here are the sites of Barnard's, Furnival's, and Thavies' Inns; the churches of S. Andrew (1686) and S. George, Bloomsbury (1731); Bedford, Russell, Queen, and Red Lion

Squares; and Hatton Garden. Handsome council buildings in High Holborn replaced the town hall in Gray's Inn Rd. in 1908. There are many large business

Holcroft, THOMAS (1745-1809). English dramatist and novelist. He was born in Leicester Fields, London, Dec. 10, 1745, the son of a shoemaker and jobmaster.

After a chequered early life, at one period of which he had a situation in the household of Granville Sharp, he became connected with the stage, and his first novel, *Alwyn, or the Gentleman Comedian*, 1780, embodies many of his own experiences. In the following year appeared his first play, *Duplicity*. He wrote four novels in all, and wrote, translated, or adapted some thirty plays. The most notable of the latter is *The Road to Ruin*, 1792. He died in London, March 23, 1809.

Thomas Holcroft,
English dramatist

Holda. Goddess of Teutonic mythology. Represented as benignant and merciful, she is a familiar figure in German popular legends and nursery tales. She is regarded as a being of the sky, and when it snows is making her bed so that the feathers fly. She drives in a wagon, and is the goddess of spinning, agriculture, and household order.

Holden, CHARLES (b. 1875). British architect. Born in Bolton, May 12, 1875, he became known as

Charles Holden,
British architect

a designer of commercial and public buildings in a style appropriate to 20th century town planning. Among his earlier works were the war memorials at

New College, Oxford, and Clifton College, and designs for the Imperial War Graves Commission, 1918-22. His outstanding works include the Royal Infirmary, Bristol; King's College of Household and Social Science, Kensington; Piccadilly Circus underground station; the headquarters of London Transport at Westminster, for which he received the R.I.B.A. architecture medal in 1929; and the new buildings of London university, 1931. He was a member of the Royal Fine Arts Commission 1933-47. He was appointed town planning consultant for Canterbury in 1943, and for the City of London in 1945; the L.C.C. also named him chief architect for the development of the S. bank of the Thames.

Holden, SIR ISAAC (1807-97). British manufacturer. Born at Hurlet, near Paisley, May 7, 1807,

son of a miner who had migrated from Cumberland, he became a teacher in Paisley in 1823, and later in Leeds. His connexion with the woollen trade began in 1830, when he secured an appointment as bookkeeper to a firm at Cullingworth, Yorks. He invented a wool-combing machine, which proved the foundation of his fortune. He was joined by Samuel Lister, afterwards Lord Masham, but after a few years each developed his own business. Holden founded the firm of Isaac Holden & Sons, a wool-combing concern at Bradford with a factory in France. In 1865 he was elected Liberal M.P. for Knaresborough, for which place he sat until 1868. During 1882-85 he was M.P. for the W. Riding, and during 1885-95 for Keighley. He was made a baronet in 1893, and died Aug. 13, 1897. His son, Sir Angus Holden, was made Baron Holden of Alston, 1908.

Holder. In banking, any person in possession of a bill who holds it either as payee, indorsee, or bearer. (See Bill of Exchange.)

Generally, the word is used for any contrivance in which something is held or secured. In engineering, the adjustable clamp for holding the armature brushes of dynamos and motors is called a holder, and many other clamps in electrical work are known by the term. Either of the two loops attached to the reins for holding a pulling horse is a holder.

Hölderlin, JOHANN CHRISTIAN FRIEDRICH (1770-1843). German poet. Born at Lauffen on the Neckar, March 20, 1770, he studied theology at Tübingen, but under Schiller's influence abandoned it for philosophy. He developed a pantheistic worship of nature and an intense admiration of the ancient Greeks. In 1798 he had a violent, though blameless, love affair with the wife of a banker named Gontard, in whose house at Frankfurt-on-Main he was as a tutor; he moved to Homburg, but the incident affected him profoundly. Nevertheless this was his greatest creative period: the romance *Hyperion*, in prose-poetry of extreme beauty, and most of his lyrics, mainly in classical forms, date from it.

In 1801 he went as a tutor to Bordeaux, but a mental breakdown forced him to return. By 1804 he had sufficiently recovered to take a librarian's post in Homburg; two years later, however, he was placed in an asylum, from which he was discharged in 1808 as incurable. Silent and unrea-

tive, he lived in the house of a Tübingen carpenter until his death, June 7, 1843.

His work includes many translations from the Greek; his *Lyric Poems* were issued in 1826, and a collected edition of his works, with letters and a life, in 1846. His popularity grew steadily, reaching a climax in the 1920s; his work has had a strong influence on German poets, notably Nietzsche. Consult biography by A. Stansfield, 1945; Hölderlin's Madness, I. Gascoyne, 1946.

Holderness. Wapentake of the E. Riding of Yorkshire, England. In the extreme S.E. of the co., N. of the Humber, and terminating in Spurn Head, it contains the towns of Beverley, Hedon, Hornsea, and Patrington. It elected one member of parliament until 1950, when it became part of the co. constituency of Bridlington.

Holding. Term used in Great Britain in the Agricultural Holdings Acts. It signifies a farm, or land with or without buildings, principally used for agriculture or market gardening. See Agricultural Holdings Acts.

Holding Company. A coy. with one or more subsidiary coys., i.e. coys. in which it holds more than 50 p.c. of the equity share capital or controls the composition of the boards of directors while holding at least one share. If a subsidiary coy. has itself subsidiaries, its holding coy. is a holding coy. of these also. Holding coys. are occasionally established when there is association of concerns in similar or complementary lines of business; the original coys. join for practical purposes and each issues to the holding coy. all its shares, the latter distributing to the original holders its own shares.

Holding over. Term of English law. It means keeping possession of land by a tenant after his tenancy has legally expired. If the holding over is with the consent of the landlord, express or implied, the tenant becomes a tenant at will. Payment and acceptance by the landlord of rent will usually amount to consent. Where in the original tenancy the rent was expressed on a yearly basis, the effect of holding over will be to create a yearly tenancy. See Landlord.

Holdsworth, SIR WILLIAM SEARLE (1871-1944). British lawyer. Born at Elmers End, Kent, May 7, 1871, he went to Dulwich College and New College, Oxford. After a year at the Inns of Court, he returned to Oxford and was a

fellow of S. John's College from 1898 until in 1922 he was appointed Vinerian professor in English law. He was made K.C. in 1920, a bencher of Lincoln's Inn in 1924, a knight in 1929, and received the O.M. a year before his death on Jan. 2, 1944. A great scholar and teacher, Holdsworth devoted most of his career to his masterpiece, *History of English Law*, which appeared in 12 vols., 1903-38. His *Essays in Law and History*, ed. A. L. Goodhart and H. G. Hanbury, appeared in 1947.

Hole, SAMUEL REYNOLDS (1819-1904). A British divine. Born at Ardwick, Lancs, Dec. 5, 1819, he

Samuel R. Hole,
British divine
Elliott & Fry

was the son of a brewer, who was also the squire of Cauntton, near Newark. From Newark grammar school Hole went to Brasenose College, Oxford. Ordained in 1844 he be-

came curate and then vicar of Cauntton. In 1887 he accepted the deanery of Rochester, where he died Aug. 27, 1904. Hole was a fine example of the muscular Christian and sporting parson. He was intimate with John Leech and others of the Punch circle. He had also a high reputation as a rose grower, and his most popular book is *A Book about Roses*, 1869. His *Memories*, 1892, and *More Memories*, 1894, are full of good stories.

Holguin, Second largest city of Cuba. It lies 65 m. N. by W. of Santiago and 15 m. N. by W. of Gibara, its port, with which there is rly. connexion. Corn, timber, tobacco, and cattle are exported, sugar is grown in the district, and the city is a centre of agricultural and cattle trading. Founded 1720, granted civic rights 1751, it has grown enormously in the 20th century. Pop. 171,997.

Holiday Camp. The basis of the holiday camp, in the sense now generally accepted, is the old-established private practice of "camping-out" in tent or caravan for recreation or pleasure, i.e. the camping holiday. Cadet corps, as well as such bodies as the Boys' Brigade and the Boy Scouts, helped to popularise among young people the notion of a corporate camp; and many holiday camps for poor children were also organized by charitable institutions early in the 20th century. Schools, too, tended increasingly to favour the idea.

Holiday Camp. These camps can accommodate upwards of 5,000 visitors. This view, at Filey, Yorks, shows the chalets in which campers are housed.

Many thousands of schoolchildren camped annually at Stratford-on-Avon. Small holiday camps existed as commercial ventures even before the First Great War, e.g. at Scarborough and Douglas, though usually these were for men only. The communal family camp on a large scale was developed commercially in Great Britain by William Butlin (*q.v.*). His first camp was established at Skegness in 1936, with accommodation for 5,500 campers, housed in chalets. Sport, entertainment, and other amenities were organized on a group basis. The venture was a success, and by 1939 other large camps were built or under construction at Clacton, Filey, and in N. Wales. Their popularity showed no sign of diminution after the Second Great War. During that war the camps afforded accommodation for naval, army, and R.A.F. training and holding depôts.

Holidays with Pay. The Holidays with Pay Act, 1938, is intended to benefit employees in industries where they are not sufficiently well organized to make with their employers collective arrangements for holidays. Under that Act and the Wages Councils Act, 1945, in any industry for which a wages council has been established by the minister of Labour, that council may recommend that workers be allowed holidays with pay; the duration to be related to the period for which the worker has been employed. There are similar provisions for the catering industry in the Catering Wages Act, 1943; and for agriculture and the road haulage industry.

Holinshed, RAPHAEL (c. 1520-80). English chronicler. He was employed in 1560 as translator by Reginald Wolfe, printer to Queen Elizabeth. Wolfe planned a universal cosmography, and when he died Holinshed became responsible for the modified form in which it

appeared (in two folio vols.), in 1577, as *The Chronicles of England, Scotland, and Ireland*. Holinshed had as assistants William Harrison, Richard Stanyhurst, and others. A second edition, in three folio volumes, appeared in 1587, and there was a reprint in six vols., 1807-08. The work, familiarly known as *Holinshed's Chronicles*, was used by Shakespeare for his historical plays. Consult Shakespeare's *Holinshed*, W. G. Boswell Stone, 1907.

Holism (Gr. *holos*, whole). The philosophy which regards nature as consisting of wholes. Natural objects, animate and inanimate, are to be considered not simply as assemblies of component parts, but as bodies representing something more than the mere sum of their elements, and which cannot be synthesised by the mechanical process of assembly. The mechanistic view of orthodox scientists assigns to mind an inferior position which the holists cannot accept; they differ in believing, firstly, that matter, life, and mind do not necessarily consist of constant elements, and secondly, that an object as a whole possesses characteristics apart from those contributed by its various component parts.

Holism embraces physics, biology, psychology, and metaphysics. It is put forward as an alternative to a science whose basis has been shaken by recent physical and mathematical discoveries, and further as a solution to the problems of creative evolution. The origins of holism are traceable from Hans Driesch's *Philosophy of Organism*, 1908. J. C. Smuts is a leading protagonist, and his *Holism and Evolution*, 1926, is a standard work. See *Philosophy*, Modern; consult also *Mechanism*, Life, and Personality, J. S. Haldane, 1921; *Life, Mind, and Spirit*, Lloyd Morgan, 1926.

Holkham Hall. Seat of the earl of Leicester in Norfolk. It is a great 18th century Palladian house built of white brick. Kent was the architect, and it was erected by Thomas Coke, 1st earl of Leicester. It contains some fine rooms, especially the picture gallery. The estate was bought in 1659 by John Coke, a son of the lawyer, Sir Edward Coke. It is famous in the history of agriculture because here

to parliament. Area, 420 sq. m. Pop. 92,330. See Lincolnshire.

Holland. Country of Europe, the nucleus of the kingdom of the Netherlands (*q.v.*). The name means woodland and was first used in 1064. It was given to a county that arose on the ruins of the Carolingian empire and was included in the Holy Roman Empire.

This county had its own rulers from about 920, though it was not

Charles the Bold, and then to her son Philip, a member of the Hapsburg family. Philip's successor was his son, Charles V, and then came Philip II of Spain. Against Philip, Holland and the N. provinces of the Netherlands revolted. Holland and Zeeland were united more closely and round them was formed, in 1579, the union of Utrecht by the seven provinces that threw off the sovereignty of Spain and were later recognized by Europe as the Dutch republic. The title count of Holland was borne by William the Silent. See Netherlands.

Holland, NORTH. Prov. of the Netherlands. It embraces the flat, low-lying country between the North Sea and the Ysselmeer (formerly known as Zuider Zee), and marches S. with Utrecht and S. Holland. Large tracts lie over 10 ft. below sea level, protected by the dunes on the W. coast and by dykes, *e.g.* the Helder dyke. The capital is Haarlem (*q.v.*), but Amsterdam is the largest town, others of note being Helder, Hilversum, Alkmaar, Zaandam, Hoorn, Enkhuizen, and Purmerend. The prov. is traversed by the Noord Hollandsch and Noord Zee canals and by lesser waterways. The Purmer, Beemster, and Wieringermeer are *polders*, or reclaimed marshes. Agriculture is the main economic feature, cattle-raising being specially important. The prov. was part of W. Friesland, and sends nine members to the first chamber. Area, 1,081 sq. m. Pop. est. 1,690,653. See Netherlands.

Holland, SOUTH. Province of the Netherlands. Adjoining N. Holland, Utrecht, and Gelderland, it includes the islands of the Rhine-Maas delta, Voorn-Putten, Beijerland, Goeree, Over Flakkee, Ysselmonde, etc. The prov. has The Hague as capital, other important towns being Rotterdam, Dordrecht, Leyden, Delft, Gouda, and Schiedam. The various branches of the lower Rhine, the Waal, Yssel, Lek, and Oude Rijn, flow through the prov., forming with the numerous canals a maze of waterways. The country is well cultivated. Area, 1,166 sq. m. Pop. est. 2,160,830. See Netherlands.

Holland. A city of Michigan, U.S.A., in Ottawa co. Situated on Macatawa Bay, an arm of Lake Michigan, it is 26 m. S.W. of Grand Rapids. It is served by the Père Marquette rly., and by lake steamers, and has flour-mills, tanneries, and a great variety of manufactures. In summer, it is the commercial centre of the lake resorts,

Holkham Hall, Norfolk. The seat of the earl of Leicester seen from the park

Coke's nephew and successor, the earl known as Coke of Norfolk, carried out his experiments, which immensely increased the rental of his estate. The village, which has an old church with a lofty tower, is on the coast, 2 m. W. of Wells. It was once a port and market town. *Pron.* Ho-kum.

Holl, FRANCIS MONTAGUE (1845-88). British painter. Son of Francis Holl, an engraver, he was born in London, July 4, 1845, and studied at the R.A. schools, beginning to exhibit in 1869. Subject pictures of modern life, rather sombre, at first occupied him, but in 1878 he exhibited a portrait of Cousins, the engraver. During his popularity as a portrait-painter his sitters included the duke of Cambridge, Lord Wolseley, Bright, Gladstone, and Joseph Chamberlain. Elected R.A. 1884, Holl died July 31, 1888.

Holland. Linen fabric used as material for dresses, aprons, blinds, etc. The name Holland cloth was originally given to linen made or bleached in Holland. Formerly holland was of very fine texture; in 1745 Defoe, inveighing against the extravagance of the times, includes holland among articles "requiring the regulation of a sumptuary law." See Linen.

Holland. Division of Lincolnshire, England, having for some purposes its own county council. The smallest and S.E. division of the co., it is chiefly fenland. Through Holland the Witham and Welland flow into the Wash. Boston, Crowland, Holbeach and Spalding are the towns, and the architecture of village churches is notable. One member is returned

until nearly two centuries later that they were called counts of Holland. Many of them were named Dirk, others Floris, and like their contemporaries they passed time mainly in fighting. In general they were successful; the result being that Holland grew from a small district round Dordrecht to one including all the land between the Texel and the Maas.

In 1299 the male line of the counts became extinct, and the county passed to John, a descendant in the female line. He was also count of Hainault and from his time that county was united with Holland. He had some trouble in establishing himself, but he succeeded, and his son William was recognized as ruler also of the district around Amsterdam and part of Zeeland, the earlier counts having disputed the lordship of these possessions with the counts of Flanders or the bishops of Utrecht. In 1345 the county line again became extinct; eventually the county was secured by William, a Bavarian prince.

In the 14th century the land was troubled by civil war between the so-called Hooks and Cods, into which Edward III of England, whose wife had claims on Holland, was drawn. William's brother, Albert, ruled well for many years and then came the latter's son, who, dying in 1417, left an only child, Jacqueline, already a widow. Ringed with foes, she struggled hard to preserve her inheritance, but in the end she was obliged to cede Holland and Zeeland to Philip the Good of Burgundy.

Holland and Zeeland passed with the rest of the Burgundian lands to Mary, the daughter of

receiving many tourists. Holland was settled by the Dutch in 1847, and chartered twenty years later. Pop. 14,616.

Holland, HENRY FOX, 1st BARON (1705-74). British politician. The younger son of Sir Stephen Fox, he was born at Chiswick, Sept. 28, 1705. Educated at Eton, he entered parliament in 1735 for Hindon, Wilts, becoming a follower of Walpole. In 1746 he was appointed secretary at war.

1st Baron Holland,
British politician
After Reynolds

He joined Pitt in attacking certain members of Newcastle's ministry, of which, however, he remained a member, and he was one of the group who controlled, by cynical arrangements among themselves, the affairs of state about this time. In 1755 Fox became secretary of state and the principal colleague of Newcastle, but in 1757 he retired and was made paymaster-general. In 1762 he was again leader of the house of commons as he had been under Newcastle, but in 1763 Bute got rid of him. He was then made a baron. He bought Holland House (*q.v.*), Kensington, and died there July 1, 1774.

Holland, HENRY RICHARD VASSALL FOX, 3RD BARON (1773-1840). British politician.

3rd Baron Holland,
British politician
After C. Leslie, R.A.

James Fox, began his career as a Whig politician. In 1806 he entered the cabinet as lord privy seal, but retired on the fall of the government in 1807. He served the Whig cause during the years of Tory rule, and in 1830, when the Whigs triumphed, was made chancellor of the duchy of Lancaster. He held that post, with two short intervals, until his death, at Holland House, Oct. 22, 1840.

Holland married in 1797 Elizabeth Vassall (1770-1845), divorced wife of Sir Godfrey Webster. They made Holland House a great social

centre. Lord Holland wrote *Memoirs of the Whig Party*, 1852. Lady Holland died Nov. 16, 1845, and in 1908 appeared her *Journal*, edited by the earl of Ilchester.

Holland, SIR HENRY (1788-1873). British physician. Born at Knutsford, Oct. 27, 1788, he was related to Mrs. Gaskell and Charles Darwin. He was educated at private schools and, after a time passed in business in Liverpool, went to Edinburgh to study medicine. Then he graduated, and in 1816 began to practise in London. He became physician to Queen Victoria, was made F.R.S., and in 1853 a baronet. A great traveller, he wrote *Travels in the Ionian Islands, Albania, Thessaly, and Greece*, 1815. He died Oct. 27, 1873. He married a daughter of Sydney Smith, and his eldest son became Viscount Knutsford (*q.v.*). Consult his *Medical Notes and Reflections*, 1840; and *Recollections of Past Life*, 1872.

Holland, HENRY SCOTT (1847-1918). British divine. Born near Ledbury, Jan. 17, 1847, he was educated at Eton and Balliol College, Oxford, afterwards becoming a tutor of Christ Church for 12 years. Greatly influenced by Liddon, Holland was ordained in 1872 and soon became known as a powerful preacher, especially after 1884, when he was appointed canon of S. Paul's. He remained there until made regius professor of divinity at Oxford in 1910. Holland was an advanced Liberal in politics. He wrote a *Life of Jenny Lind*, 1909, and *A Bundle of Memories*, 1915. He died at Oxford, March 17, 1918.

Holland, JOHN PHILIP (1841-1914). American inventor. Born at Lisconnor, co. Clare, Ireland, he was a schoolmaster at Limerick until he emigrated to the U.S.A. He was teaching in New Jersey when the American Civil War broke out, and the naval action between the Merrimac and the Monitor turned his attention to the possibilities of a submersible warship. Although his first experimental boat in 1875 was a failure, he pro-

duced at last in 1898 a serviceable submarine, with a 50-h.p. petrol engine for surface cruising and electric storage batteries for underwater propulsion. It was commissioned by the U.S. navy, and the British Admiralty acquired all the patents for Great Britain. The inventor died at Newark, N.J., Aug. 12, 1914.

Holland, SIR THOMAS ERSKINE (1835-1926). British jurist. Born July 17, 1835, son of a Sussex clergyman, he was educated at Brighton College and Balliol College, Oxford. He became a barrister in 1863, and soon made a reputation as a student of jurisprudence. In 1874 he was appointed Vinerian reader in English law at Oxford and professor of international law and diplomacy. He held the post until 1910. Knighted in 1917, he was a fellow of the British Academy. Holland's great work is *The Elements of Jurisprudence*, which appeared in 1880. He also wrote *Studies in International Law*, 1894; *The Laws of War on Land*, 1904. He died May 24, 1926.

Holland, SIR THOMAS HENRY (1868-1947). An English geologist. Born at Helston, Nov. 22, 1868, he entered the Indian civil service in 1890, to become president of the mining and geological institute of India in 1906. He directed the geological survey of the country from 1903 until in 1909 he returned to England as professor of geology and mineralogy at Manchester. Knighted in 1908, Sir Thomas was rector of the Imperial College of Science and Technology, 1922-29, then 15 years principal and vice-chancellor of Edinburgh university. He was vice-president of the Royal Society, 1924-45. He died May 15, 1947.

Holland House. Historic London mansion. It stands in its own grounds, Holland Park, between Kensington High St. and Holland Park Avenue in the bor. of Kensington (*q.v.*). It is a notable example of Jacobean architecture, and, when Macaulay wrote his

H. Scott Holland,
British divine
Elliott & Fry

Holland House, London. The Jacobean mansion seen from the garden

essay on Addison, 1843, could "boast of a greater number of inmates distinguished in political and literary history than any other private dwelling in England." The centre building and turrets, 1607, were built by John Thorpe for Sir Walter Cope. The house, known as Cope Castle, was extended for the 1st earl of Holland, husband of Cope's daughter.

Here died Joseph Addison three years after his marriage to the widow of the 3rd earl of Warwick and Holland. The house was bought by Henry Fox, created Baron Holland in 1763, and on the death of Lady Holland, widow of the 4th baron, in 1889, the property passed by purchase to the earl of Ilchester, a descendant of Henry Fox's brother. In the time of the 3rd Lord Holland and his brilliant if imperious wife Holland House became a social and political *salon* and the headquarters of the Whigs.

In 1940 the house was damaged by fire from German incendiary bombs, and several H.E. bombs fell in the grounds.

A statue of the 3rd Lord Holland by Watts is in the grounds facing Kensington High St. The house contains valuable pictures and relics. In Holland Park in 1804 Lord Camelford was mortally wounded in a duel with Col. Best. Consult Macaulay's Essay on Lord Holland, 1841; Holland House, Princess Lichtenstein, 1874; The Holland House Circle, C. Sanders, 1908.

Holland Park. District between Holland Park Avenue and Kensington High St., London, W. With a number of the adjacent thoroughfares and the station of the Central Line, it takes its name from the park containing Holland House. At No. 12 (N. side), Holland Park Road, just N. of Kensington High St., is Leighton House, long the residence of Lord Leighton; it was presented to the borough council by his sisters as a centre for the promotion of the arts. It was damaged by German bombs in 1940.

Hollands. Variety of gin sometimes called Schiedam or Schnapps. It is manufactured near Schiedam in Holland, from barley, malt, and rye. See Gin.

Hollands(ch)e. Arm of the Maas estuary, Holland. It runs between the S. coast of South Holland and the coast of N. Brabant to the E. of Willemstad. It is in effect a continuation of the Haringvliet and Kramer-Volkrak arms, and runs up towards the delta of

the Biesbosch (*q.v.*). Its entrance is defended by two shore forts.

Hollar, WENCESLAUS (1607-77). A Bohemian engraver. Born at Prague, July 13, 1607, he studied

Wenceslaus Hollar, Bohemian engraver
From a print

under Merian at Frankfurt, publishing his first plates in 1625. By the earl of Arundel, English ambassador to Germany, he was brought to England in 1637 and appointed drawing master to the prince of Wales (afterwards Charles II); and at the outbreak of the Rebellion fought for the royalists. He afterwards escaped to Antwerp, but returned in 1652, and in 1660 was made draughtsman to the king. After the Great Fire of 1666 he engraved a map of London, leaving the burnt portions blank. Loss of employment, with extravagance, made him poor. He died bankrupt, March 28, 1677.

His views of towns include those of Oxford, Cambridge, Hull, Richmond, Greenwich, old and new London. He also showed in engravings, 1640-44, the dress of women of all classes in Europe. The British Museum has a fine collection of Hollar prints. See Becket illus.

Holles, DENZIL HOLLES, 1st BARON (1599-1680). English politician. A younger son of John Holles, 1st earl of Clare, he was born Oct. 31, 1599, and educated at court with Prince Charles, afterwards Charles I. In 1624 he entered the house of commons.

In March, 1629, being then M.P. for Dorchester, he was one of those who held the Speaker down in the chair while he asked members to approve of the resolutions of protest to the king. For this he was imprisoned and fined, but made his escape abroad. He opposed the collection of ship money, and was a member of parliament when it was called together again in 1640. Holles had a hand in most of the great events that preceded the Civil War. He was one of the Five Members (*q.v.*) whose attempted arrest precipitated the outbreak.

1st Baron Holles, English politician

Holles raised a regiment and fought at Edgehill and Brentford, but he was not very desirous of pressing the appeal to arms. He is next found as the chief opponent of Cromwell and the army, for which he was impeached, fleeing to France. He sat in parliament in 1659, and went to The Hague to invite the king to return. In 1661 he was made a peer. From 1663 to 1666 he was ambassador in Paris; in 1667 he arranged with Holland the treaty of Breda. Later he took up an attitude of opposition to Charles II, acting with Shaftesbury. He died Feb. 17, 1680. The title became extinct when his grandson, the 3rd baron, died in 1694, and the family is now represented by the duke of Newcastle (*q.v.*).

Hollingshead, JOHN (1827-1904). A British journalist and theatrical manager. Born in Hoxton, London, Sept. 9, 1827, he had a brief experience of business and began to contribute to Household Words. He was a voluminous writer for many years, and assisted many public movements with his pen, such as that for the better government of London, and the agitation for copyright reform. After three years as stage director of the Alhambra, where he introduced much-needed reforms, in 1868 he became manager of the Gaiety Theatre, where he had many successes in the drama. He died Oct. 10, 1904.

Hollins, ALFRED (1865-1942). British blind musician. Born Sept. 11, 1865, in Hull, he studied piano and organ at the Royal Normal College for the Blind, and later under Hans von Bülow. He first publicly appeared at 13, at the Crystal Palace, and subsequently toured the U.S.A. with a quartet of blind musicians. Later he appeared with leading American orchestras. Organist at St. George's West Church, Edinburgh, Hollins composed organ and piano music and songs, and wrote *A Blind Musician Looks Back*, 1936. He died May 17, 1942.

Holloway. Name of two wards, Upper and Lower Holloway, in the met. bor. of Islington, London. The district includes the Royal Northern Hospital, 1856, rebuilt 1892, enlarged 1909 and 1923; the old Caledonian (Metropolitan Cattle) Market, 1856, closed 1939; the Pentonville prison, 1840-42; the Northern Polytechnic, opened 1896; and two famous taverns, the Brecknock Arms, at the junction of Camden and Brecknock Roads, and the Nag's Head, at

Holloway. Entrance to the Women's prison in Camden Road, sometimes called Holloway Castle

Holloway Road corner of Seven Sisters Road.

Holloway prison, a castellated structure built 1849-52, has accommodation for 1,000 women prisoners, mostly serving short sentences. Suffragettes before the First Great War were imprisoned here and, going on hunger strike, were subjected to forcible feeding. In 1945 Dr. Charity Taylor was appointed first woman governor of the prison.

Upper Holloway Baptist Chapel, long associated with the ministry of the Rev. J. R. Wood, was built in 1866. Islington's first public library was opened in 1906 in Manor Gardens, and the Central Library in Lower Holloway in 1907. The Piccadilly line station is called Holloway Road.

Holloway, THOMAS (1800-83). British patent medicine maker.

Thomas Holloway, patent medicine maker

Born at Devonport, Sept. 22; 1800, the son of a baker, he came to London in 1828, and nine years later concocted an ointment and a pill which he advertised very extensively. His success was largely due to the fearlessness with which he spent money on advertising. He acquired a handsome fortune, and, on Lord Shaftesbury's advice, founded a sanatorium, which was opened at Virginia Water in 1885. He also founded the Royal Holloway College for women (*v.i.*), and formed a picture gallery on which he spent more than £83,000. He died at Tittenhurst, Berks, Dec. 26, 1883.

Holloway College, ROYAL. College of the university of London in arts and science, at Englefield Green, Surrey. Founded and endowed as a college for women students by Thomas Holloway, and opened by Queen Victoria in

lection of pictures, including examples of Constable, Gainsborough, Morland, and Millais. It is surrounded by grounds containing science laboratories, a botany garden, swimming bath, and playing fields.

Holly (A.S. *holen*, *holeyn*). Hardy evergreen tree of the family Aquifoliaceae, and genus *Ilex*. *Ilex aquifolium* is a native of Great Britain, but foreign species were introduced from N. America as far back as 1726. The leaves are usually spiny and dark green, though there are smooth and variegated sorts, and the red or yellow berries are borne in winter. Hollies should be planted in late spring and early autumn, while the soil is still warm. Any ordinary soil is suitable, provided the young plants are put in deeply so that the roots are adequately protected against frost. Holly makes one of the best hedges, but it is of slow growth, and needs constant clipping to keep it within bounds. To propagate, take the berries when ripe, just before Christmas, burying them in sand for twelve months,

Holly. Leaves and berries of *Ilex Hendersoni*. Top, leaves and berries of the British species

and then planting them in the open, transplanting the young trees three years afterwards. *I. paraguayensis*, which yields maté, or Paraguay tea, needs greenhouse treatment, in loam and sand.

Hollyhock (med. Eng. *holihok*, holy hock or mallow) (*Althaea rosea*). Hardy perennial herb of the family Malvaceae. A native of China, it was introduced in 1573. The leaves are large, rough, and rounded, and it bears a single spike (8 to 10 ft.) of white, pink, yellow, or purple flowers, either single or double. Its height makes it suitable for hiding an ugly wall or fence in the hardy herbaceous border, and it will thrive in any soil that is not too light. By planting deeply and fertilising liberally with nitrate of soda in the height of summer, a profusion of bloom and a variety of "sports" or varying colours are readily obtainable. These new varieties are best propagated from seed gathered after the flower stems have died down, and planted

Hollyhock, leaves and flowers; bottom, right, the "cheese" containing seeds, and a single seed

in a temperature averaging 55° in Jan. or Feb., planting out in May for summer flowering. If left undisturbed for three or four seasons they may produce self-sown plants, both single and double.

Hollywood. Suburb of Los Angeles, California, U.S.A. It is regarded as the headquarters of the American film industry, though now virtually all the leading film personalities live outside it and only three major studios are here. Lying 8 m. W. of the centre of Los Angeles and 12 m. from the Pacific, it has the Hollywood Hills to the N., the Los Angeles river to the E., and the residential community of Beverly Hills to the W. With a semi-tropical climate, it presents a garish spectacle of stucco bungalows, streets lined with palm and pepper trees, restaurants built in the form of castles, fish, and ice-cream cornets, and strollers in the flamboyant slacks and smoked glasses affected by both sexes in the film industry.

The site of a single adobe house in 1853, Hollywood became a

160-acre fruit farm, and was incorporated as a village in 1903. The first Hollywood film, *The Law of the Range*, was made by the Nestor Company in 1911. Other companies followed, attracted by the climate and low rents; and today it has three of the industry's largest studios, the others being in Burbank, Culver City, and other neighbouring communities. Here are the Hollywood Bowl, a 60-acre natural amphitheatre with seats for 20,000 and standing room for 10,000 more; the Hollywood Legion stadium; the Japanese Gardens, with 30,000 trees; a Buddhist temple; and Grauman's Chinese Theatre, where Hollywood stars leave their footprints in cement. Allied industries, such

as the manufacture of celluloid, films, and cosmetics, have grown up beside the main business. Pop. 184,531.

Holman, James (1786-1857). A British traveller. The son of a chemist, he was born at Exeter, Oct. 15, 1786, served in the navy, 1798-1810, and had reached the rank of lieutenant when he became totally blind. A man of remarkable strength of will, he studied at Edinburgh university, and in 1812 was made a naval knight of Windsor. Obtaining leave to travel, he visited France, Italy, Savoy, Switzerland, Germany, and Holland, 1819-21; Russia, Siberia, where he was arrested as a spy, Poland, Austria, Saxony, Prussia, and Hanover, 1822-24; made a voyage round the world, 1827-32; and then travelled in Spain, Portugal, S.E. Europe, Syria, and Turkey. He published three accounts of his wanderings, before he died in London, July 29, 1857.

Hollywood. Scenes in the unique "film city" of California. 1. Hollywood Boulevard. 2. A street between the studios. 3. An Easter sunrise service in the Hollywood Bowl, attended by 30,000 people. Choir members wearing white surplices form a cross in the centre. Fanfares on trumpets and the releasing of thousands of doves mark the moment of sunrise

Holman, Joseph George (1764-1817). British actor and dramatist. The son of an army officer, he was born in Aug., 1764, and educated at Queen's College, Oxford. He made a highly successful début at Covent Garden, Oct. 25, 1784, as Romeo. After three seasons he severed his connexion with Covent Garden and went to Dublin and Edinburgh. In 1812 he left England for the U.S.A., where he met with great success. He died at Long Island, Aug. 24, 1817. A rival of John Kemble, he won appreciation from Lamb and Macready, his successes including *Hamlet* and *Colonel Townley*. His plays belong to the school of Holcroft, and are now negligible.

Holmby House. Name of a Northamptonshire mansion. The existing Holmby (or Holdenby) House, about 7 m. N.W. of Northampton, was built in the 19th cent., its predecessor being one of the great 16th cent. domestic palaces.

Here James I is said to have stayed, and Charles I was forcibly detained in 1647 after his surrender to the Scots at Newark. Holmby House boasted a larger frontage even than Blenheim Palace and Castle Howard, its main façade measuring no less than 360 ft. The only remains of the original building are two archways and part of the N. side of the second quadrangle.

Holme Cultram. Urban dist. and parish (Holme Abbey) of Cumberland, England. It stands on the Waver, 5 m. N.W. of Wigton. The church of S. Mary occupies the site of a 12th cent. Cistercian abbey, and was restored in 1885. Among the monuments is the tomb of Robert Bruce, father of the Scottish king of that name. Farming implements are manufactured. Pop. 4,735.

Holme Lacy. Parish and village of Herefordshire, England. It stands on the Wye, 5 m. by railway S.E. of Hereford. Holme

Lacy House, formerly the seat of the Scudamores and more recently of the earl of Chesterfield, is a fine 17th cent. building containing a splendid collection of pictures and some excellent wood-carvings by Grinling Gibbons. In the Norman church, dedicated to S. Cuthbert, are noteworthy monuments of the Scudamore family. Pop. 250.

Holmes, SIR CHARLES JOHN (1868-1936). British art critic and painter. Born at Stratton, Cornwall, Nov. 11, 1868, he was educated at Eton and Oxford and studied at the Slade school. He was Slade professor at Oxford, 1904-10; director and secretary of the National Portrait Gallery, 1909-16; director of the National Gallery, 1916-28; knighted 1921, and made K.C.V.O., 1928. A member of the New English art club, he was the first to paint industrial Britain, and his water colours of canals, factories, and pitheads of the Midlands set a new fashion in simplicity of design and colour. Holmes wrote in 1898 an appreciation of Hokusai, the Japanese master; also monographs on Constable and Rembrandt. He died Dec. 7, 1936. There are examples of his art at the Tate Gallery, the Ashmolean Museum, and at Manchester and Johannesburg.

Holmes, OLIVER WENDELL (1809-94). American essayist and poet. Born at Cambridge, Mass., Aug. 29, 1809, he was the son of a Unitarian minister. Educated at Andover and Harvard, he began to study law, but turned to medicine and completed his studies in Paris, 1833-35. He started in practice in Boston, 1836, the year in which he published his first volume of poems. Having been physician at the Massachusetts General Hospital and lectured on anatomy and physiology, 1838-40, he became professor in those subjects at Harvard, 1847-52. A paper in 1843 on the contagiousness of puerperal fever won him some renown. In 1840 he married, and in 1849 gave up practice and apart from professional work devoted himself to literature.

It was by *The Autocrat of the Breakfast Table*, 1858, that he established his position as an essayist of a new type working on the borderland of fiction, and also strengthened his position as poet. This work had appeared serially during the preceding year in *The Atlantic Monthly*, where it was followed by the similar work, *The Professor at the Breakfast Table*, 1860. A dozen years later came *The Poet at the Breakfast Table*.

In this trilogy is included the best of Holmes's prose and poetry. Wit and humour, fancy and poetry, are blent into a fascinating whole which is informed with a broad humanitarianism.

His novels, *Elsie Venner*, 1861, *The Guardian Angel*, 1867, and *A Mortal Antipathy*, 1885, occupy a subsidiary position; they present interesting pathological and psychological problems in a suggestive and impressive manner, but the discursiveness of the essayist was ill-suited to the form of the novel. Holmes also wrote biographies of Motley and Emerson. His work, especially the *Breakfast Table* series, and some of the poems such as *The Wonderful One Hoss*

Oliver Wendell Holmes

After A. Schöff, 1897

Shay, *The Chambered Nautilus*, *Dorothy Q.*, and *Grandmother's Story of Bunker-Hill Battle*, became as popular in England as in America, and when in 1886 he paid a second visit to Europe he had in England something of an ovation, and recorded his experiences in *Our Hundred Days in Europe*, 1887. In *Over the Tea-cups*, 1890, he sought to revive the spirit of *The Autocrat* with, for an octogenarian, remarkable success. He died Oct. 7, 1894. Collected works, 13 vols., appeared in 1891; *Lives*, W. Jerrold, 1893; L. W. Townsend, 1909.

Holmes, OLIVER WENDELL (1841-1935). American jurist, son of the above. He was born in Boston, March 6, 1841, and after graduating at Harvard served in the Civil War. In 1867 he was admitted to the Massachusetts bar. He gained a high reputation by his editorship of the *American Law Review*, 1870-73. In 1882 he became a judge of the supreme court of Massachusetts; from 1899

chief justice, he was translated in 1902 to the supreme court of the U.S.A. Retiring 1932, he died in Washington on March 6, 1935. Holmes exercised a profound influence on legal thought, bringing a spirit of liberalism into the interpretation of the U.S. constitution.

Holmes, SIR ROBERT (1622-92). English sailor. He served in the royalist army during the Civil War, and on the Restoration, 1660, was given a command in the navy. He took part in the battle of Lowestoft, and distinguished himself against the Dutch, whose East Indian fleet he burned at Vlissingen, off Holland, in an action known as Robert Holmes's bonfire. In 1667 he was promoted admiral, and in 1669 was M.P. for Winchester and appointed governor of the Isle of Wight. In 1672, on the renewal of war with Holland, he commanded a squadron and fought in the battle of Sole Bay. He died Nov. 18, 1692.

Holmes, SHERLOCK. Central character of 60 stories by Sir A. Conan Doyle, first presented in the novel *A Study in Scarlet*, 1887. The subsequent full-length stories were *The Sign of Four*, 1889; *The Hound of the Baskervilles*, 1902; and *The Valley of Fear*, 1915. The 56 short stories were collected in five other volumes: *The Adventures of S. H.*, 1891; *The Memoirs of S. H.*, 1893; *The Return of S. H.*, 1904; *His Last Bow*, 1918; and *The Case-Book of S. H.*, 1927. All stories, short and long, except the first two named, appeared originally in *The Strand Magazine*, in which the illustrations by Sidney Paget helped to establish the popular conception of the figure. As early as 1893 the author had already tired of Holmes, and in the final story of *The Memoirs* described his dramatic death while ridding the world of an arch-criminal, Professor Moriarty; but in deference to public demand the detective was resuscitated some years later and remained alive almost as long as his creator. Holmes is an amateur detective of extraordinary astuteness in the solution of criminal mysteries by a process of scientific deduction, and is still regarded as the classic detective of fiction. His austere and fascinating personality is so consistently described in the course of the stories, which range in period from the early 1880s to 1914, that he gives the illusion of having been a real person. Many admirers have searched in vain for his consulting rooms at "221B, Baker Street"; while several writers have been

able to compile pseudo-biographical studies as a literary jest. Holmes's companion, Dr. Watson, narrator of the stories, became almost as famous. Plays and films have been based on the adventures of Holmes, many of the latter being "apocryphal." See *Detective Fiction*; consult Conan Doyle, Hesketh Pearson, 1943.

Holmes, THOMAS (1846-1918). British criminologist. Born at Pellsall, near Walsall, the son of an ironmoulder, he taught in a night school for some years, and in 1885 was appointed police-court missionary at Lambeth police court, being transferred in 1889 to the N. London court. In this capacity he became a leading authority on criminology. He died March 26, 1918. Holmes's publications included *Pictures and Problems from London Police Courts, 1900*; *Known to the Police, 1908*; *London's Underworld, 1912*.

Holmfirth. Urban district and town of the W. Riding of Yorkshire, England. It is 6 m. S. of Huddersfield, with its own railway station. In 1938 the urban district was extended to include Honley, Holme, and New Mill. Woollens are manufactured and stone is quarried. The bursting of Bilberry reservoir in 1852 caused 80 deaths; in 1944 a cloudburst killed three people and caused damage to the extent of £300,000. Market day, Tues. Pop. 18,000.

Holmium. A rare earth metal occurring in gadolinite and other minerals. It is a trivalent element, symbol Ho, with yellowish salts and forms a chloride, HoU_3 , an oxide Hc_2O_3 , and other salts. The element has not yet been prepared in the free state. The atomic weight is 163.5.

Holm Oak (*Quercus ilex*). Evergreen tree of the family Fagaceae, a native of S. Europe and N. Africa. The leathery leaves, which last for

two years, vary in form from oblong to lance-shaped and may be toothed or not. The underside is whitish with a downy covering. The long, slender acorns ripen in their second year. Holm is a corruption of middle Eng. *holin*, holly, whose leaves those of the holm oak resemble in their texture.

Holocene (Gr. *holos*, whole; *kainos*, recent). Geological period which forms the top of the Kainozoic era. The most recent in the time scale, it continues to the present day. The boundary between the Holocene and the next older period, the Pleistocene, has been fixed at the date when the retreating Scandinavian ice-sheet had melted to such an extent that it became subdivided into two separate sheets at Ragunda—about 10,000 years ago.

Holocene deposits consist largely of river alluvium, scree, gravels, peat, sand dunes, salt-marsh beds, etc. The Fenland area in England is of this age. Submerged forests, e.g. near Rhyl, and the peat deposits found on the Dogger Bank probably belong to this period. Man's most rapid development has been during the Holocene, which includes the Mesolithic and Neolithic cultures. The end of the Palaeolithic cultures is considered contemporaneous with the close of the Pleistocene.

During this period the melting of the great Pleistocene ice sheets removed a heavy load off N. Europe, Asia, and N. America. Scandinavia and the Baltic area, where the ice was very thick, are rising steadily; in the centre of this area old shore lines have been elevated about 800 ft. In Scotland, the St. Lawrence estuary, and Labrador, evidence of recent uplift can also be seen. Canada, N. of the Great Lakes, is slowly tilting S.; if this continues the drainage from Lake Michigan may be diverted into the Mississippi. England, too, is tilting S.E., at a measurable rate. The sinking of the S.E. counties is between 1 and 2 ft. per century. Mountain building, which reached maximum intensity during the earlier Tertiary times, continues in the Netherlands E. Indies. Faulting in W. America has been observed, by earthquakes and also by actual displacements of the present-day land surface. Despite its relatively short duration this period has seen remarkable earth movements.

Gilbert Wilson, Ph.D.

HolocrySTALLINE. Term used to describe the texture of an igneous rock composed entirely of

individual minerals or interlocking crystals to the exclusion of any volcanic glass. HolocrySTALLINE rocks have usually cooled slowly so that there has been time for complete crystallisation of the constituents.

Holofernes. Personage mentioned in the apocryphal book of Judith as the chief captain of the army of Nebuchadrezzar. The Hebrew maiden Judith saved her people by slaying him before the walls of Jerusalem.

Holograph (Gr. *holos*, whole; *graphein*, to write). A deed, will, or other document wholly written by the person making and signing it. This is one of the methods by which a deed may be formally executed in Scotland.

Holophytic. Biological term applied to organisms which synthesise their organic food from inorganic material absorbed in solution. The synthesis is normally dependent on sunlight, from which energy for the process is derived by chlorophyll.

Holothurian (Gr. *holothourion*). Order of echinoderms, commonly known as sea-cucumbers. They are all marine, and resemble large slugs or worms. The mouth is at one extremity, and in life is surrounded by plume-like tentacles. The skin is tough and leathery, and usually contains small chalky spicules. The length of the creatures ranges from 6 ft. to about an inch, and they vary greatly in form and appearance. Some can contract and elongate their bodies to a remarkable extent: others, when irritated, eject their internal organs in the form of a mass of sticky threads. There are numerous genera and species, many being found in the British seas; but most of the larger ones are natives of the tropics. Certain kinds, known as trepang or bêche de mer (*q.v.*), are valued as food by the Chinese.

Holotricha. Order of the class of protozoa called the ciliata. The animals in this order have similar cilia all over them, in contrast to the heterotricha.

Holozoic. A biological term applied to organisms which obtain their nourishment by taking in organic material in solid form and digesting it to obtain what they require.

Holroyd, SIR CHARLES (1861-1917). British artist. Born at Leeds, April 9, 1861, he studied art at the Slade School, and passed two years in Italy, afterwards becoming assistant to Prof. Alphonse Legros at the Slade. He was

Holm Oak. Leaves and acorn of this South European evergreen

known as an etcher of force and originality, much of his work appearing at the R.A. exhibitions. He was keeper of the Tate Gallery, 1899-1906, and director of the National Gallery, 1906-16. He wrote a Life of Michael Angelo, 1903. Knighted in 1903, he died at Weybridge, Nov. 17, 1917.

Holst, GUSTAV THEODORE (1874-1934). British composer. Of Swedish extraction, he was

Gustav Holst,
British composer

born Sept. 21, 1874, at Cheltenham, educated there, and studied at the Royal College of Music. Neuritis compelled him to abandon the organ for the trombone, which he played with the Scottish orchestra and at Covent Garden. From 1905 he was music master at S. Paul's girls' school; from 1919 he taught composition at the R.C.M., and was director of music at University College, Reading, 1919-23.

His compositions are outstanding for orchestral technique, and show the two diverse influences of English folk-song and of the East. In his so-called Sanskrit period, 1906-11, he wrote seven sets of Hymns from the Rig-Veda, the opera Savitri, to his own text, and The Cloud Messenger, for chorus and orchestra. The Planets suite for orchestra, 1915, was wholly English in its background. He followed these with the choral Hymn of Jesus, 1917 and Ode to Death, 1919; the operas The Perfect Fool, 1921, and At The Boar's Head, 1924, both to his own words; and a choral symphony, 1924. Other works include a fugal overture and fugal concerto, suites for strings and for military band, and part-songs. Holst's style is direct, forceful, and highly personal; a fondness for harmonic clashes and quintuple and septuple time contrasting with a gift for simple melody. He died May 25, 1934. His daughter Imogen, also a talented composer, wrote his Life, 1938.

Holstein. A former German duchy, then the S. part of the Prussian province of Slesvig-Holstein. It lay S. of the river Eider and the Kiel Canal, and included the former duchy of Lauenburg. Famous for its horse and cattle breeding, good grain in parts, and garden land, its largest

city was Kiel. There were textile, iron, cigar, foodstuffs, and ship-building industries.

About 800 the future duchy arose as a northern outpost of the Saxon tribes, which were subjugated by Charlemagne and split up into several countries. It fought neighbouring heathen Slavonic peoples (later the Danes) with alternating success and defeat, until its rulers became powerful, especially when, under Count Gerhard III the Great, Slesvig and later Denmark fell to the Holstein dynasty, 1304-26. Successors of several dynasties kept the duchies together, frequently in personal union with Denmark. One duke became the Tsar Peter III of Russia in 1762. With the end of the Holy Roman Empire in 1806 the duchies enjoyed a large degree of autonomy under the Danish crown and, from 1815, within the German Confederation. The struggle for or against their reunion with Germany is described under Slesvig-Holstein Question.

Holsworthy. Urban district and market town of Devon, England. It is 46 m. W. by N. of Exeter, with a rly. station. Agricultural trade is carried on. The Holsworthy and Bude Canal, constructed 1819-26 from near Holsworthy to Bude, is now abandoned, only two of its 33 m. being in use. The annual horse fair of S. Peter is held in July. Market day, Wed. Pop. 1,403.

Holt. Town of Norfolk, England. Situated on rising ground a few miles inland, 10 m. W. of Cromer, it has a railway station, and is the site of Gresham's school, founded 1554. Market day, Fri. Pop. 2,250.

Holtby, WINIFRED (1898-1935). British author. She was educated at Scarborough and Somerville

College, Oxford, and became a director of Time and Tide in 1926. Her first novel, *Anderson Wold*, was a sympathetic study of Yorkshire life. It was followed by *The Crowded Street*; *The Land of Green Ginger*; *Poor Caroline*, 1931; *Mandao Mandao*, 1933; *Truth is Not Sober* (short stories), 1934: her masterpiece, *South Riding*, published posthumously in 1936, was awarded the James Tait Black prize, and

Winifred Holtby,
British author

was later filmed. Other works included a critical study of Virginia Woolf, 1932; and a satire, *The Astonishing Island*, 1933. Winifred Holtby died after a long illness endured with remarkable courage, Sept. 29, 1935; her life is recounted in *Testament of Friendship*, V. Brittain, 1940.

Holt Line. British steamship company. It consists of the Ocean Steamship co. and the China

Holt Line Flag.
Blue with white
diamond

Mutual Steam Navigation co. The former was founded by Alfred Holt in 1865, and its first vessel went from Liverpool round the Cape to Singapore and China, but this route was abandoned for the shorter one on the opening of the Suez Canal. The China Mutual co. was founded in 1882, and passed to Holt & co. in 1902.

The line runs a cargo service from Birkenhead to the Straits Settlements, China, and Japan, with extensions to the Philippines. Other services are from Birkenhead and Amsterdam to Indonesia, from Glasgow and Liverpool to Australia via Panama, and to the Straits Settlements and Indonesia via Suez; from New York to China and Japan. In 1915 the company purchased the Indra line of steamers plying between N. America and the Far East, and in 1917 four steamers owned by the Knight Steamship co. It is commonly known as the Blue Funnel Line. Its head offices are at India Buildings, Liverpool.

Hölty, LUDWIG (1748-76). German lyric poet. Born at Mariensee, Hanover, Dec. 21, 1748, he went to Göttingen university, where he became one of the founders and the most promising member of the circle of poets known as the Göttinger Dichterbund. His career was cut short by consumption two years after he left the university, and he died at Hanover, Sept. 1, 1776. His collected poems, 1782, contain many songs and odes of great beauty, but with a strain of tragic melancholy underlying them.

Holtzmann, HEINRICH JULIUS (1832-1910). German theologian. Born at Karlsruhe, May 17, 1832, he studied at Berlin and became professor at Heidelberg, 1861, and at Strasbourg, 1874. His chief fame was won as critic and commentator on the New Testament; his works including *Die Synoptischen Evan-*

gelien (The Synoptic Gospels), 1863; *Einleitung in das Neue Testament* (Intro. to the N.T.), 1885; and *Neutestamentliche Theologie* (N.T. Theology), 1897. He died Aug. 6, 1910.

Holy Alliance. THE. Treaty concluded at Paris in 1815, after the final abdication of Napoleon, by Alexander I, emperor of Russia, Francis II, emperor of Austria, and Frederick William III, king of Prussia. The three monarchs bound themselves in their relations with their subjects and with other powers to be guided by the principles of Christianity. The compact was really a recrudescence of the notion of divine right, and its political motive was to maintain the settlement made in Europe after Napoleon's fall. The treaty was subsequently subscribed to by all other European monarchs, except the Sultan, who was not asked, and the prince regent of Britain, who declined. Through the influence of Metternich, the Austrian diplomatist, the Holy Alliance degenerated into an instrument for resisting revolutionary tendencies, as when France interfered to check a movement towards constitutional reform in Spain in 1823. *See Europe: History.*

Holy Carpet. Popular name for the *kisweh*, or outer covering of

Holy Carpet. Scene during the procession of the carpet in Cairo, where it is made for the Ka'aba at Mecca

the Ka'aba, a building in the centre of the mosque at Mecca. It was formerly presented annually by the Sultan. Manufactured in Cairo, it is sent with the caravan of pilgrims to the holy city. It is of a coarse black brocade, covered with inscriptions from the Koran, etc., which are interwoven in silk of the same colour, and has a broad band across each side ornamented with inscriptions worked in gold. After having remained on the Ka'aba for nearly a year, the *kisweh* is taken off, cut into pieces, and sold to the pilgrims.

After 15 days the new covering is put up. *See Ka'aba: Mecca; consult also Manners and Customs of the Modern Egyptians, E. W. Lane, 5th ed. 1860.*

Holy Coat of Trèves. Relic, preserved in the cathedral at Trèves (Trier). It is alleged to be the seamless coat of Christ for which the soldiers cast lots at the Crucifixion, and to have been brought from Palestine by S. Helena when she discovered the Holy Cross. It is first mentioned in history in 1106, and soon afterwards was placed in a chest under the high altar, where it remained till about 1512, when the pope

sanctioned its exhibition once in seven years. The last occasion was in 1891, after an interval of 47 years, when a photograph taken revealed a curious negative impression of the face of Christ upon it. Numerous miracles are alleged to have been wrought through the relic, which now is only a fragmentary piece of linen.

Holy Cross. Summit of the Rocky Mountains in Colorado, U.S.A. Situated near the centre of the state, it derives its name from two snow-filled ravines intersecting at right angles and presenting a cruciform appearance. It is 14,170 ft. high.

Holy Cross, Colorado, showing the cruciform fissures which give the mountain its name

Holycross Abbey. Picturesque ruins of Cistercian abbey in Holycross, vill., co. Tipperary, Eire, 4 m. S.W. of Thurles. The abbey, near the river Suir, was founded in 1182 by Donnell O'Brien, king of Thomond, and owes its name to a supposed fragment of the true cross presented to his family and

Holy Coat of Trèves. From a German lithograph issued in connexion with an exhibition of this relic at Trèves in 1891. The figure represents S. Helena

now enshrined in the Ursuline Convent at Black Rock, near Cork.

Holy Ghost OR SAINT ESPRIT, ORDER OF THE. French order of knighthood. Founded by Henry III in 1575, it was last bestowed by Louis XVIII. The badge is a white cross pommée, with golden fleurs-de-lis in the angles. The ribbon is sky-blue watered silk. See Holy Spirit; Knighthood.

Holyhead. An urban dist., seaport, and market town of Anglesey, Wales. It stands on the N. side of Holyhead Is., a boat train terminus, and is the port of departure for British Railways steamers to Dublin. It has a fine harbour of refuge (begun in 1847 and opened in 1873), protected by a breakwater $1\frac{1}{2}$ m. long, and covering 267 acres. The old harbour has been considerably im-

Holyhead. The lighthouse which stands on the rocky coast of Holyhead Island, Anglesey

proved since the new one was completed. Market day, Sat. Pop. 11,757. Holyhead Mountain is an eminence of 720 ft.

Holyhead Island OR HOLY ISLAND. Island to the W. of Anglesey, Wales, connected with the county, to which it belongs, by an embankment over which the railway passes. It is 8 m. long, from $\frac{1}{2}$ m. to 3 m. broad, and has a generally barren surface. See Anglesey.

Holy Island OR LINDISFARNE. Island off the E. coast of Northumberland, England, about 2 m. from the mainland. This island is only at certain states of the tide, and is reached from Beal village by cart or on foot across a sandy track, marked by beacons and refuge boxes. In the S.E. is a small fishing village, a popu-

lar summer resort, with golf links, and the harbour. S. Aidan founded a monastery here in 635, and S. Cuthbert was a bishop of the see. The monastery was destroyed towards the end of the 9th century, and a Benedictine priory church was erected on its site in 1093. There are ruins of this church and also of S. Mary's, built in 1130, both erected by the Normans, and a 16th century castle. The priory figures in Scott's metrical romance Marmion.

Holy Land. Name frequently given by Christians to Palestine, because of its association with Jesus Christ. See Palestine.

Holyoake, GEORGE JACOB (1817-1906). British pamphleteer. Born April 13, 1817, at Birming-

ham, he early identified himself with the Chartist movement and took part in the Bull Ring riots of 1839. In 1841 in Sheffield he kept a school and lectured on rationalism. While editing *The Oracle of Reason*, he abjured Christianity, and was sentenced to six months' imprisonment for blasphemy. In 1846 he returned to London, where he published *The Reasoner* and in 1850 *The Leader*. His atheistical views had become modified when in 1854 he published *Secularism* (a word he coined), the *Practical Philosophy of the People*.

From his bookshop in Fleet Street Holyoake brought out pamphlets and books denouncing the Crimean War, and demanding the extension of the franchise and other social reforms. In 1876 he started *The Sectarian Review*. A leader of the cooperative movement, he wrote its history in 1875. He died Jan. 22, 1906, at Brighton.

G. J. Holyoake, British secularist
Elliott & Fry

Holy of Holies. Inner chamber of the Jewish Tabernacle (Ex. 26) and of Solomon's Temple (1 Kings 6). Alternative terms are the Most Holy Place and Presence Chamber of the Divine King. The Holy of Holies contained the Ark of the Covenant. See Tabernacle; Temple.

Holyoke. City of Massachusetts, U.S.A., in Hampden co. It stands on the Connecticut river, 8 m. N. of Springfield, and is served by rlys. The public library, the city hall, and several hospitals are the chief buildings. Holyoke is a busy industrial city, its factories obtaining power from a large dam across the river, which here descends 60 ft. Paper has long been an important product, and motor cars, bicycles, furniture, woollens, cottons, silk, machinery, bricks, wire, and screws are also manufactured. Mount Tom and Mount Holyoke are picturesque places in the neighbourhood. Before 1850, when it was incorporated, Holyoke formed part of West Springfield; it was chartered as a city, 1873. Pop. 53,750.

Holy Orders. Name given to the estate or degree of those who are admitted to the Christian ministry by the laying on of hands of a lawfully ordained bishop. As recognized in the Ordinal of the Church of England there are three grades of holy orders: bishops, priests, and deacons. In the Latin Church, which regards Holy Orders as sacramental, they include bishops, priests, deacons, and subdeacons, and the minor orders: acolytes, exorcists, readers, and door-keepers. Those in minor orders are persons set apart for work of a less spiritual character. The minor orders originated in the first half of the 3rd century. See Apostolic Succession; Bishop; Deacon; Episcopacy; Ordination; Priest; consult also Orders and Unity. C. Gore, 1910; *The Apostolic Ministry*, ed. K. E. Kirk, 1946.

Holy Places. Term applied since the Middle Ages to the places in and around Jerusalem associated with the life of Jesus Christ. The chief is the Holy Sepulchre; others are Gethsemane and the Mount of Olives. In 1230 Pope Gregory IX appointed the Franciscans as custodians of the holy places, and later there were disputes between the Eastern and Western Churches over this question, which was the immediate cause of the Crimean War, France and Russia both claiming the guardianship. See Jerusalem; Palestine; Sepulchre.

Holy Island. The 16th century castle on this island off the Northumberland coast, also called Lindisfarne

Holy Roman Empire. This institution of medieval Europe is noted under Empire, Holy Roman.

Holy Rood (A.S. *rôd*, rod). Ancient name for the Holy Cross. Holy Cross Day (Sept. 14) is the dedication festival of the two churches built at Jerusalem by Constantine in 335. Introduced in the West in the 7th century, it celebrates the restoration of the relic of the Cross by Heraclius in 629, after it had been carried away by Chosroes, king of Persia. See Cross; Rood.

Holyrood. Name of abbey ruins and palace, Edinburgh, Scotland. The abbey was founded by David I in 1128, first on the Castle Rock, then on its present site, for

and of Mary and Darnley. Charles I was crowned; David II, James II, James V, and Darnley were buried here. To the abbey and its precincts until 1880 attached the privilege of sanctuary, first for civil and criminal offenders, and then for debtors.

The palace, built by James IV in 1498-1503, burnt by accident Nov. 13, 1650, restored by Cromwell, 1651-58, was rebuilt by Charles II, 1671-79. Prince Charles Edward held his balls and *levées* in the picture gallery, 1745-46, and here the lord high commissioner to the general assembly of the Church of Scotland holds his *levée* each May, and here also the Scottish representative peers

are elected for each new parliament. Holyrood has been the residence of British sovereigns visiting Edinburgh since the days of George IV. Features of interest are the apartments of Queen Mary,

Properly called the Church of the Resurrection, it was put up in the 4th century by Constantine the Great (*q.v.*). The tomb in which Christ is believed to have been buried consists of a cave 140 ft. N.W. of the hill of Calvary. The natural rock was cut away and the cave isolated; over it was erected a circular building called the Anastasis. In 1009 the roof and upper parts of the rock walls of the tomb were destroyed by Muslims. The present church, which shelters both the tomb and Calvary, was built by the Crusaders; seriously damaged by fire in 1808, it was later restored. Dissident Copts, Armenians, and Syrians share with Roman Catholics the use of the church.

Holy Spirit, THE. In Christian theology, the third person of the Trinity. The evolution of the doctrine goes back to the O.T., in which the term Spirit is used to denote the Divine Activity or God in Action.

The term itself, both in Hebrew and in Greek (*ruach* and *πνεῦμα*), originally meant "breath" or sometimes "wind," the underlying idea being that of invisible force. "The Spirit," therefore, in the first instance signified the Divine invisible force which actuated and energised the whole universe. It was the agent of God in creation—of prophetic inspiration—the dynamic of moral progress. With development of a pure monothe-

ism and abandonment of anthropomorphic conceptions of God the work of the Spirit received emphasis, until it was finally hypostatized and differentiated from God. In the Wisdom literature the Spirit is often associated with the Wisdom of God, the former denoting more particularly the moral, the latter the intellectual form of the Divine activity.

In the N.T. the doctrine gained a new access of strength. In particular the governing adjective Holy, which in the O.T. is used twice only (Ps. 51, v. 11; Isaiah 63, v. 10), became an almost inseparable element in the idea. The result was that the activity of the Spirit was almost entirely restricted to the moral and spiritual sphere. The N.T., however, does

Holyrood. 1. Remains of the abbey. 2. Bedroom of Mary Queen of Scots in this Edinburgh palace

Augustinian canons regular. Its dedication, attributed by a 15th century legend to its founder's preservation from death by the miraculous appearance of a rood or cross, is more likely to have been associated with a golden cruciform casket bearing an ebony image of Christ, and containing what was regarded as a piece of the true cross, left to the king by his mother, Margaret. David presented this reliquary to his abbey, and it came to be known as the Black Rood of Scotland. Surrendered to Edward I in 1291, restored in 1328, it was taken into battle by David II, lost at Neville's Cross in 1346, was placed in Durham Cathedral, and disappeared at the Reformation.

The abbey was reconstructed in 1464, destroyed by the English 1544-69, reconstituted as the Chapel Royal in 1672, and reduced to ruins in 1768. It was discovered in 1911 that the foundations of the choir rested on those of an earlier church and burial-ground containing about 40 graves. For some time the occasional residence of Scottish kings, the abbey was the scene of the marriages of James II, James III, James IV,

Darnley, and the audience-chamber. A dark stain on the floor outside the private apartments is said to have been made by the blood of Rizzio (*q.v.*). Much care has been taken to keep the structure of the palace in repair. See Ceiling; Edinburgh; consult also History of Holyrood, publ. R. McBean, 1870; Historical Sketch, Sir H. E. Maxwell, 1915.

Holy See. Term denoting the episcopal see of the R.C. church in Rome. It is more generally applied, however, to indicate the pope as supreme pontiff, together with those associated with him in the Vatican in the general government of R.C. international affairs.

Holy Sepulchre, CHURCH OF THE. Building in Jerusalem over the supposed tomb of Christ.

not always make a clear distinction between the Holy Spirit and the Spirit of the Risen Christ; in fact sometimes, as in 2 Cor., 3, v. 17, "The Lord is the Spirit," it seems to identify the two conceptions. The best definition of the function of the Spirit in the N.T. is to be found in the fourth gospel. He is "the Spirit of Truth," and will lead men to a knowledge of the truth (John 16, v. 13). He is the Divine Paraclete who bears witness to Christ (15, v. 26). "Sin, righteousness, and judgement" are the three great themes which form the essence of His message (16, vv. 8-11). In the history of the Early Church the Holy Spirit was the source of the Divine Power which fell upon the first Christian community at Pentecost, and of the spiritual endowments of the Apostles and other Christians.

The doctrine of the Spirit never became a matter of serious controversy in the history of the Early Church, though it was always to a greater or less degree involved in the Christological and Trinitarian controversies of the first four centuries. The only heresy which was specially concerned with it alone was Macedonianism, which, while accepting the Nicene formula on Christology, denied the consubstantial Divinity of the Holy Spirit. In later times a controversy on what is known as the "filioque" clause of the Nicene Creed caused the final cleavage between the Eastern and Western Churches, since the Eastern Church while acknowledging the procession of the Holy Spirit "from the Father," refused to accept the clause concerning the "procession from the Son."

Consult The Holy Spirit in the Ancient Church, H. B. Swete, 1912; The Interpreter Spirit and Human Life, A. J. Macdonald, 1944.

Holy Thursday. Name given to the day on which the Christian Church commemorates the Ascension of Jesus Christ. Being forty days (both inclusive) from Easter Sunday, this festival falls always upon a Thursday. Maundy Thursday is also sometimes, but incorrectly, called Holy Thursday. See Ascension.

Holy Water (Lat. *aqua benedicta*). In the R.C., Greek, and Russian Churches, water blessed by bishop or priest. It is placed in a basin or stoup at church entrances. The original idea seems to have been that worshippers should wash their hands, and so be able to lift up pure hands in prayer. Its modern use is symbolical, and

derived from Jewish custom, by which washing of the hands is still prescribed before devotions. The Romans had a similar ceremonial use of the *aqua lustralis*.

In apostolic times the only holy water, apart from that mingled with the wine at the Eucharist, was that used at baptism. In the Anglican communion the use of

Holywell Street, London, in 1900, looking west

From London Vanished and Vanishing, by Philip Norman, by courtesy of Adam and Charles Black

holy water was abandoned at the Reformation, but the baptismal service contains a prayer for the sanctification of "this water to the mystical washing away of sin." See Baptism; Lavabo.

Holy Week. To Christians, the week before Easter. A period of special solemnity in the Christian Church, it is also called the Great Week, though neither term appears in the Book of Common Prayer. The application to it of the name Passion Week is incorrect, that being the week following Passion Sunday, or the 5th Sunday in Lent. In the time of S. Chrysostom (c. 400) religious exercises of fasting, prayer, and almsgiving were increased, business was suspended, and prisoners were released in commemoration of Christ's death and burial. See Easter; Passion Week.

Holywell. Urban dist. and market town of Flintshire, Wales. It stands on the Dee estuary, 4 m. N.W. of Flint, with a rly. station. The water of S. Winifred's Well (the "holy well"), one of the wonders of Wales, is said to have remarkable curative powers. The water supply was considerably reduced by drainage construction and further tunnelling operations caused a temporary cessation of the flow in Jan., 1917. The well,

which supplied a number of mills with power, is covered by a Gothic chapel, erected by the countess of Richmond, mother of Henry VII. The remains of Basingwerk Abbey (12th century) are near by. Market day, Mon. Pop. 8,500.

Holywell Street or **BOOKSELLERS' ROW.** Former London thoroughfare between S. Clement Danes and S. Mary-le-Strand, named after a spring, once a halting place for Canterbury pilgrims. Its 17th cent. houses were used successively by silk mercers, dealers in second-hand clothing, and second-hand and discount booksellers. The Opéra Comique Theatre here was built partly on the site of Lyon's Inn, an old chancery inn. The street, closed in 1901, was demolished in the Strand improvement scheme. See Aldwych; Strand.

Holywood. Urban district and seaport town of co. Down, N. Ireland. It is on Belfast Lough, 4 m. N.E. of Belfast. A church was founded here by S. Laisieran, son of Nasca, in the 7th century, and the place was called after him Ard-Mic-Nasca, height of the son of Nasca. In the 16th century the church was bestowed on the Franciscans, who established a small monastery, its site now marked by the ruins of a later church. A solemn league and covenant for the defence of the kingdom was signed here in 1644. Pop. 6,359.

Holy Year. In the R.C. church, year in which extraordinary plenary (jubilee) indulgence is granted by the pope to all who make a pilgrimage to Rome. It begins on the previous Christmas eve with the opening, and ends 12 months later with the closing, of the holy doors at the basilicas of S. Peter, the Lateran, S. Paul, and S. Mary Major, which are walled up between holy years. The first recorded holy year was in 1300, and it has since been kept at the successively reduced intervals of 100, 50, 33, and 25 years.

Holz, ARNO (1863-1929). German writer and poet, born April 26, 1863. His first publication, *Klinginsherz*, a volume of verse, appeared in 1882. An admirer of Zola, he gave rein to realism in the *Buch der Zeit*, 1885 and 1892, and in *Neue Gleise*, 1892. He extended this treatment to his plays, several of which were written in collaboration with Jerschke. Amongst these may be mentioned *Traumulus*, 1904; *Frei*, 1905. *Phantastus*, 1899, contains poems of beautiful rhythm. Holz died Oct. 26, 1929.

Holzminden. Town of W. Germany, in Lower Saxony. It is an inland port on the Weser, about 30 m. N.W. of Göttingen, and it makes iron, wood products, glass, chemicals, and machinery. Boat-building is also carried on. Pop. (1949) 21,000.

Homage (late Lat. *homaticum*, old Fr. *homage*). Profession of allegiance made to his lord by a feudal tenant on receiving his property. The profession was made in the following words: "I become your man (*homo*) for the lands which I hold of you, and will be faithful to you against all men, saving the fealty which I owe to my lord the king." To some extent the practice survives in England at the present day, for a bishop still does homage to the sovereign on his appointment to a see. At a coronation bishops, princes of the blood, and peers in their respective order do homage to the newly crowned sovereign. See Feudalism; Investiture.

Homatropine. Alkaloid prepared from tropine and mandelic acid. The hydrobromide is a white crystalline powder, used in medicine to produce dilatation of the pupil, for examination or treatment of the eye. The word is from the Greek *homos*, same, and *Atropos*, the name of one of the Greek Fates.

Homburg vor der Höhe. German town and spa, 9 m. N. of Frankfurt-on-Main. Formerly in Prussia, it is in the *Land of Hesse*. Saline and chalybeate springs, known since the early 17th century, made it fashionable in the 18th, and it received patronage from the prince of Wales (Edward VII). Its castle, built 1885, was the residence of the landgraves of Hesse to 1866; the nearby Saalburg, one of the biggest Roman castles, reconstructed by William II, a lavish Kurhaus, and parks and surrounding hills, were further attractions. The notorious casino was closed in 1872. Some engineering, leather work, chocolate making, and above all hat making are carried on in the outskirts of the town; the soft Homburg hat was popularised by Edward VII. Pop. (1949) 25,770.

Home, EARL OF. Scottish title borne since 1605 by the family of Home or Hume. The family became known on the borders in the 14th century, and soon won wealth and importance. Sir Alexander Home was killed at Verneuil in 1424, and a later Sir Alexander was made Lord Hume in 1473. Alexander, the 6th lord, having

figured in the disorders of the times in Scotland, went with James VI to England in 1603, and was made an earl in 1605. The title came in 1841 to Cospatrick Alexander, who married the heiress of the last Baron Douglas, and in this way Douglas Castle and other lands in Lanarkshire of the great Douglas family passed to the Homes, who have since been known as Douglas-Home. The 11th earl was made a peer of the U.K. as Baron Douglas in 1875. Charles, the 13th earl (b. 1873), succeeded his father in 1918. The family estates are in Berwickshire and Lanarkshire, and the eldest son is known as Lord Douglas. *Pron.* Hume. See Douglas.

Home, DANIEL DUNGLAS (1833-86). Scottish spiritualist medium. He was born near Edinburgh,

D. D. Home,
Scottish spiritualist

March 20, 1833, and inherited psychic gifts from his mother, Elizabeth McNeill, who was credited with second sight. He was taken to America and adopted by an aunt, who was so disturbed by manifestations of occult influence that she turned the boy out of her house. Before he was 20 his séances had made Home famous in the U.S.A., where distinguished men proclaimed the genuineness of phenomena witnessed by them. Home came to England in 1855, and in the course of the next 17 years acquired a prodigious reputation there and on the Continent, where his séances and lectures convinced scientists. Among the sceptics was Robert Browning, who pilloried him in *Mr. Sludge the Medium* (1864).

Home was twice married, both his wives being Russians of high birth. In 1872 his health gave way, and he spent the rest of his life in retirement abroad, dying at Auteuil, June 21, 1886. A large quantity of literature has grown up around Home and his gifts, or pretensions, as to which no complete explanation has yet been given. He compiled *Incidents in My Life*, 1863, and wrote *Lights and Shadows of Spiritualism*, 1877. Consult *Experiences in Spiritualism* with D. D. Home, Earl of Dunraven, 1924.

Home, JOHN (1722-1808). Scottish dramatist. Born at Leith, Sept. 21, 1722, he was educated

at Edinburgh university. After an adventurous connexion with the rebellion of 1745, in which he

fought on the royalist side, he became minister of Athelstaneford, near Haddington. Here he began to write his plays and poems, being chiefly remembered by his rhetorical tragedy Douglas, which, produced at Edinburgh in 1756, enjoyed great contemporary success. Compelled to resign his charge by the Edinburgh presbytery, who regarded playwrighting as incompatible with the ministry, Home ultimately became tutor to the prince of Wales, and received a pension from his old pupil when the latter came to the throne as George III. He died at Merchiston, Sept. 5, 1808.

John Home,
Scottish dramatist
After Raeburn

Home Chat. Weekly magazine for women, founded by Alfred Harmsworth, later Lord Northcliffe. Its first issue was on March 23, 1895. With *Answers* and the *Sunday Companion* it helped to found the fortunes of what is now the Amalgamated Press (*q.v.*).

Home Counties. Name given to the counties round London: Middlesex, Surrey, Kent, Essex, Herts, Bucks, and Berks.

Home Fleet. Units of the Royal Navy based on ports in the U.K. During the Second Great War it was called the Atlantic Fleet. It is responsible for the defence of the North Sea, N. Atlantic, English Channel, and areas as far as Gibraltar.

Home Forces. Command of the British army during the Second Great War. In Sept., 1939, the command of the army at home was based on a static organization comprising Eastern, Western, Northern, Southern, Scottish, and Aldershot commands and two independent districts, all headquarters working under the War office. But in May, 1940, G.H.Q. Home Forces was formed, the commands and independent districts coming under it. After D-day, June 6, 1944, the number of troops in the U.K. decreased until in July, 1945, it was possible to disband G.H.Q. Home Forces, organization of the army reverting to the 1939 basis. Training forces for service abroad was the responsibility of Home Forces, as well as the formation of the 21st army group for the invasion of Europe.

HOME GUARD: A GREAT CITIZEN ARMY

Lieut.-Gen. Sir Douglas Brownrigg, K.C.B., D.S.O.

The story of Great Britain's part in the Second Great War would be incomplete without this account of the remarkable body which sprang into existence overnight at the most critical period of the struggle, to become a very great potential asset in home defence

The Home Guard, originally the Local Defence Volunteers, began its four and a half years of life on May 14, 1940. This was the day on which the German armoured formations broke through the 9th French army about Sedan; but it was quite by chance that Anthony Eden, secretary of state for War, had selected that moment for a broadcast appeal for volunteers from men of all ages between 17 and 60 who were capable of handling a gun. The force was called into being to oppose the possible landing on British soil of German parachute troops. The reports of such landings in Norway, France, Belgium, and Holland had suddenly awakened the people of Great Britain to the realization that they could no longer rely on sea power alone to protect them from invasion.

Rapid Enrolment

In ten days 400,000 volunteers had enrolled, and by the end of the month the figure had risen to one million. On its first birthday the total was about 1½ millions, and on its "standing down," Dec. 31, 1944, there were well over 1½ millions on the strength. The Local Defence Volunteers began enrolling when Great Britain stood in greater peril than at any time since the Napoleonic threat, but when they stood down that peril had passed and victory was certain.

The Home Guard was never actually engaged with the enemy, except for those members who had voluntarily joined, or had been compulsorily posted to, the heavy and rocket batteries of A.A. units; but there is no question that the existence of this great national part-time unpaid army, which had been allotted a definite and most important rôle in the defence of Great Britain, enabled the military authorities progressively to liberate regular forces, first for training at home as opposed to garrison duties, and later for service overseas in armies of liberation.

In the earliest days volunteers armed themselves with shotguns and any other personal weapons on which they could lay their hands; and an official issue was begun after two months of a few P.14 rifles made available from the U.S.A., together with an allow-

ance of ten rounds of ball ammunition for each weapon. Gradually this trickle of rifles swelled into a flood of lethal appliances, until the average battalion was armed with a variety of weapons, including rifles, bayonets, light automatics, machine carbines, heavy machine-guns, spigot mortars, and mobile artillery in the shape of Smith guns. Members of the force were also trained in the use of many types of grenades. The basis of training was the defence of their own localities, which implied strategic immobility; but no defence being complete without tactical mobility, this was supplied by a certain amount of mechanical transport and the use of members' own cars, licensed and insured by the government.

It is idle to generalise about a force which was raised in localities of such varying character. One battalion in the Highlands was recruited over an area of 900 sq. m., whereas a sector in outer London comprised nine battalions all located within 50 sq. m. Besides the general battalions raised in each locality, there were special units, companies, or battalions, largely raised from the big factories, railway companies, and electricity and gas works. These were originally raised for the defence of their own premises, most of which were recognized as points of danger. But as ideas of local defence were revised, they gradually merged into the general defence schemes.

Women Auxiliaries

In time the work done by the women's services with the regular forces persuaded the government to admit women as "auxiliaries" in the Home Guard; but women were never given the full recognition they deserved as fulfilling in the Home Guard a rôle similar to the one they performed in the regular forces.

During air raid attacks from 1940 onwards the Home Guard took a big share in helping Civil Defence. In London 200 men in each battalion were trained in light and heavy rescue work; every night each battalion provided an inlying picket at platoon strength for any emergency call.

In 1942 compulsory enrolment in the Home Guard was intro-

duced for those who were of suitable age and not performing work of national importance which might suffer in consequence. This kept up the numbers in the force, but had little or no effect on its spirit, which had been voluntary and remained so. The maximum amount of training which could be demanded from a member was 48 hours a month; but this was usually exceeded by officers and n.c.os. in a great many battalions.

Service was unpaid; but a scale of subsistence allowances was laid down to prevent a man from being out of pocket through travelling to and from his place of parade, or through providing himself with extra meals away from home. Army uniform was provided, though it did not include shirt or, a more considerable item, socks.

After a time a small regular staff was allotted to each battalion or corresponding unit, consisting of an adjutant, a captain in charge of administration, and one or more permanent staff instructors. Sector headquarters were also allowed a regular training officer and a staff officer. From 1941 Home Guard officers were given king's commissions.

A Unique Force

The Home Guard was a typical improvisation, which, it is no exaggeration to say, could not have worked satisfactorily in any other country in the world. One field marshal worked as a private in a battalion intelligence section; a lieutenant-general received a Home Guard commission as a colonel, and had as his second in command an admiral of the fleet, both serving under a regular sub-district commander whose substantive rank was lieutenant-colonel.

The official date of the final disbandment of the Home Guard was Dec. 31, 1945. Consult The Home Guard of Britain, C. Graves, 1943; Britain's Home Guard, J. Brophy, 1945.

Homeless Children. Children deprived of normal family life. Provision for such children developed in a piecemeal way in England, private philanthropy having started societies like the Foundling Hospital (g.v.), Dr. Barnardo's, and the national children's homes. With the abolition of boards of guardians in 1930, it became the duty of every public assistance authority to provide shelter for destitute children. These authorities could place children in voluntary homes known as certified homes. Both voluntary societies and public assistance

authorities could also board children out in foster-homes selected and inspected by them.

In 1947 there were 886 voluntary homes registered with the Home Office; the six largest voluntary societies being linked through the association of children's homes. Approximately 70 voluntary societies cared for 33,500 children; public assistance authorities for 32,885. Children in approved schools, remand homes, evacuation hostels, residential special schools, and boarded out with foster-parents brought the total of homeless children to 124,900.

Public concern, aroused by several bad cases, led to the appointment in 1945 of the Curtis committee on care of children; its recommendation that responsibility for homeless children should be concentrated in one government department was followed by the co-ordination, 1947, in the children's branch of the Home Office, (the Scottish home department exercising similar functions in Scotland), of all functions relating to homeless children, which previously belonged some to the Home Office and some to the ministries of Education and Health; the number of local inspectors was also increased, and local authorities were required to appoint children's officers.

By the Children Act, 1948, a duty of providing for homeless children was placed upon the county or county borough councils as the local authority. This duty arises whenever a child under 17 has neither parent nor guardian, or is abandoned or lost, or where his parents or guardians are prevented by disease, infirmity, or other incapacity or circumstances from giving him a proper home and upbringing, and the intervention of the local authority is necessary for the child's welfare. Where a child has no parents or guardians, or they have abandoned him or are permanently incapable of or unfit to have care of him, the local authority may resolve that all parental rights shall vest in them. The local authority must provide accommodation and maintenance for children in their care either by boarding them out or by maintain-

Home Office. The offices in Whitehall, built in 1875

ing them in a children's home provided by them or by some voluntary society.

Home Office. Government department in the U.K. Its head, the Home secretary, is the senior of the eight secretaries of state. He has a special personal relation to the sovereign, for through him the king issues communications

to his people, and on his advice exercises the prerogative of mercy and right of pardon. He was formerly required to be present at the birth of royal children.

The establishment of the board of trade, the local government board (now the ministry of Health), the ministry of Labour, and other departments has relieved the Home Office of much public business; the main functions remaining to it are the preservation of the liberty of the subject, public safety, the administration of justice, the control of foreigners and the grant of naturalisation, the protection and care of children, administration of prisons, and control of the criminally insane.

The Home secretary has direct control over the police in London and indirect control in the provinces. He has duties with regard to elections, liquor licensing, and the control of dangerous drugs. *See also* Home Security.

HOMER AND HIS TWO GREAT EPICS

J. H. Freese, M.A., Late Fellow, St. John's College, Cambridge

This article is supplemented by the account of Greek Literature, and by those on the other Greek poets and dramatists, e.g. Hesiod and Sophocles. See Epic; Troy; and the characters of the Homeric poems, e.g. Achilles; Hector; Helen; Menelaus; also Mythology

Homer (Gr. Homēros) was the reputed author of the famous Greek epics, the Iliad and the Odyssey. The ancient accounts of his life are legendary and unhistorical. Some scholars regard him not as an individual, but as a type of the wandering bard, while others consider him a purely mythical figure, like Orpheus. There seems, however, no reason to doubt that a poet named Homer really existed. Seven cities, Smyrna, Chios, Colophon, Salamis (in Cyprus), Rhodos, Argos, Athenae, each claimed the honour of having been his birthplace; the period at which he lived is variously placed, ranging from 1200 B.C. to 850 B.C. or later. The original home of the poems was the west coast of Asia Minor, in Aeolic Smyrna and Ionic Chios, where a clan called the Homeridae (descendants of Homer) is known to have lived, who devoted themselves to the recitation of the poems.

Tradition describes him as blind, a characteristic of the bard unfitted to be a warrior, just as the author of the Delian Hymn to Apollo, wrongly attributed by the ancients to Homer, describes himself as a blind singer from rocky Chios. Besides the Iliad and the Odyssey, several other poems were

attributed to Homer: the so-called Homeric Hymns, the battle of the frogs and mice, a satirical poem called Margitēs (the Block-head), and a collection of epigrams, nearly all of later date.

The nucleus of the Homeric poems was the story of Troy, and the legends that grew up around it. The Iliad (about 15,500 lines) relates the events of 51 days of the tenth and last year of the siege of Troy by the Greeks. The central incident is the wrath of Achilles, his withdrawal from and subsequent re-entry into battle after the death of his friend Patroclus. The Odyssey (12,000 lines) describes the wanderings of the "crafty" Odysseus (Ulysses), a typical Ionian seafarer, on his way back from the Trojan war, his return home, and the vengeance exacted by him from the suitors of his wife Penelope.

The Homeric epics, sung by the rhapsodes (professional bards), soon became known all over the Greek-speaking world as the national poems, it might almost be said as the national bible. Herodotus declares that Homer (and Hesiod) were the creators of the Greek religious system. Plato calls him the educator of Greece, and he was known as the poet. The Athenian legislator Solon laid

down regulations for the recitation of the poems, and Peisistratus, the "tyrant" of Athens (c. 540 B.C.), set up a commission to edit the complete text in a definite form for recitation at the national festival of the Panathenaea.

From an early date the poems engaged the attention of the learned, chiefly the philosophers and rhetoricians, who explained them allegorically or subjected them to a rationalistic method of treatment. The first real critical work, however, in connexion with the text and its elucidation was done by the Alexandrian grammarians (2nd century B.C.). Most prominent amongst these were Zenodotus of Ephesus, Aristophanes of Byzantium, and Aristarchus of Samothrace. To this period also belongs the division of the *Iliad* and *Odyssey* into 24 books each. The work by these scholars was carried on in the East for centuries, but in the West Homer was almost forgotten during the Middle Ages, and remained so until the revival of Greek studies, due mainly to the influence and efforts of the Greek scholars who fled from Constantinople after its capture by the Turks in 1453. The first printed edition of Homer appeared in 1488.

The Disputed Authorship

In ancient times, Homer's claim to the authorship of both poems was generally recognized, although it was admitted that they contained numerous interpolations. Even in the Alexandrian age, however, certain critics known as *Chorizontes* (the separators) assigned the *Odyssey* to a different poet and a later date. In modern times, the critical study of the Homeric poems began with F. A. Wolf (in 1795), who put forward the theory, now substantially accepted, that the *Iliad* and *Odyssey* were made up of a number of separate short lays, the work of one man, containing the chief incidents, afterwards amplified by others and finally combined into a whole. It is now generally agreed that the *Iliad* and *Odyssey* are certainly not by the same author and that they belong to different periods of time. The general tone of the *Odyssey* indicates a later period of civilization; the atmosphere is less heroic, less warlike, less primitive, the language and descriptive style are different; the sphere of geographical knowledge is extended; and, above all, the religious views and feelings are not the same. The narratives of the *Iliad* and *Odyssey* only dealt with a small section of the Trojan legend. To supplement this, a number of poets belonging to the Ionian school,

natives of places far apart and whose dates ranged from about 776-570 B.C., endeavoured to furnish a consistent account of pre-Homeric and post-Homeric happenings in such a manner as to present a complete mythological cycle, or circle, of Trojan and other heroic legends. These poems were afterwards arranged in chronological order by grammarians in a prose version called the epic cycle, their authors becoming known as the cyclic poets.

The chief of these epics were the *Cypria* of Stasinus of Cyprus, an account of events from the marriage of Peleus to the beginning of

Homer, from the bust in the National Museum, Naples

the Trojan war; the *Aethiopis* and the *Sack of Troy* by Arctinus of Miletus, the first relating the slaying of the Aethiopian Memnon by Achilles, the death of Achilles himself, and the suicide of Ajax; the *Little Iliad* of Lesches of Mitylene, dealing with the events of the war from the quarrel over the arms of Achilles to the capture of the city; the *Nostoi* of Hagias of Troezen, describing the return of the heroes from Troy; and the *Telegonia* of Eugeamon of Cyrene, named after the son of Odysseus by Circe, who, in quest of his father, unwittingly killed him.

Although the question of the authorship and mode of composition of the poems will probably never be satisfactorily answered, their place in the world's literature remains unassailable. They are the oldest monuments of Greek literature, and furnish, in abundant detail, material for the study of early Greek religion and the conditions of society. Matthew Arnold calls them "the most important poetical records existing," characterised by rapidity, plainness of thought and diction, and nobility of con-

ception, and, notwithstanding certain defects of detail and construction, they still remain unsurpassed as works of art. Not only succeeding writers in epic and other branches of poetry, but artists also drew inspiration from the figures that crowd their pages. Zeus (Jupiter), Apollo, Achilles, Hector, Odysseus, Penelope, and others are familiar literary and artistic types. The influence exercised by the Homeric poems through the medium of Virgil is clearly shown in such works as Milton's *Paradise Lost*, Tasso's *Gerusalemme Liberata*, and Dante's *Divina Commedia*.

Bibliography. The literature of Homer is vast. For the English reader, *The Problem of the Homeric Poems*, W. D. Geddes, 1878; *Introduction to Homer*, R. C. Jebb, 8th ed. 1896; and the English prose translations by A. Lang, W. Leaf, and E. Myers (*Iliad*), rev. ed. 1901; S. H. Butcher and A. Lang (*Odyssey*), rev. ed. 1903, are to be recommended, also the *Odyssey* of T. E. Lawrence, 1935. Pope's verse translation remains the best attempt. Useful editions of the text with English notes are: *Iliad*, W. Leaf, 2nd ed. 1900-02; D. B. Monro, 4th ed. 1894; *Odyssey*, W. W. Merry, i-xii, 2nd ed. 1886; xiii-xxiv, D. B. Monro, 1901.

Homer, WINSLOW, (1836-1910). American painter. Born at Boston, Mass., Feb. 24, 1836, he studied at the New York National Academy of Design. During the American Civil War he contributed sketches to *Harper's Weekly*, and began to paint and exhibit genre pictures bearing on the war. He was elected associate of the American Academy in 1864, academician in 1865, and received many other honours. Homer did not confine himself to military subjects, but painted genre of every description and some landscapes. His style, technically crude at first, later developed genuine power, while he was throughout independent of the recognized schools of art. He died Sept. 30, 1910.

Homer Pigeon or **HOMING PIGEON**. Name given to a breed of domestic pigeon used for carrying messages or for racing. It is so called from its remarkable instinct in returning to its home at full speed when released many miles away. Since Roman times homer pigeons have conveyed messages in military operations. Numbers were used in both Great Wars by the Royal Corps of Signals, and in Great Britain they proved valuable when air raids disrupted telephonic communication. Pigeons also served with the R.A.F., two accompanying each aircraft on operational flights, lest the aircraft was forced down and the radio put out of action.

Homerton. Part of the met. bor. of Hackney, London, E., bordering Hackney Marsh in the E. The Eastern Hospital for infectious diseases and the Hackney General Hospital are in Homerton; the Congregational training college, founded in the 17th century, was destroyed during the Second Great War, when the district suffered severely from German bombing. Homerton was a fashionable suburb in Stuart times. The Old House at the Corner, a Tudor residence near Sutton Place, is owned by the National Trust.

Home Rule. Name given to the Irish movement for self-government between 1870 and 1914 and to the measures taken to establish a separate Irish parliament. Discontent with the political union of 1801 became canalised into a parliamentary programme after 1870. C. S. Parnell, elected M.P. 1875, became chairman of the Home Rule movement in 1880, took all Home Rulers into permanent opposition, and led a policy of obstructionism, designed to bring the proceedings of parliament to a standstill until Home Rule was granted. In 1885 the Home Rulers secured for them a position in which they held the balance between Liberals and Conservatives.

In 1886 Gladstone, then Liberal prime minister, introduced the first Home Rule bill, which split his party. The bill was defeated, as was the government in the subsequent election. But Home Rule remained in the Liberal programme throughout the party's period in opposition, 1886-92. Returning to power in 1892, Gladstone introduced a second Home Rule bill in 1893. This was passed by the commons only to be rejected by the lords. From then until 1912 Home Rule remained in abeyance, as it was obvious that any further bill the commons might pass would meet with the same fate. But the Parliament Act of 1911, which curbed the veto of the lords, opened the way for the third Home Rule bill of 1912, introduced by Asquith's Liberal government. This met a troubled course on its way to the statute book, and caused feeling between the parties to run dangerously high. The lords threw the bill out twice.

The final fight began in March, 1914. Modifications had been made respecting the position of Ulster, which was by this time in a state bordering on armed resistance against the bill. The government now proposed to deal with Ulster in an amending bill which

provided that she could vote herself out of the Act by counties. The house of lords proceeded to amend the revised bill in ways obviously unacceptable to the commons, thus creating a deadlock. At the suggestion of King George V, a conference was held at Buckingham Palace between representatives of government, opposition, Nationalist, and Ulster members, but no conclusion was reached. The conference broke up almost on the eve of the First Great War. The government insisted on the bill's passage into law, though a bill was also passed postponing the operation of the Home Rule Act for one year or until after the war had ended. The Home Rule bill received the royal assent Sept. 18, 1914.

The Act reduced Irish representation in the U.K. parliament, and provided *inter alia* for an Irish senate (40 members) and house of commons (164), also for the recognition of the supreme authority and power of the U.K. parliament, naming explicitly all the subjects on which the Irish parliament could not legislate. This 1914 Act was generally accepted by the Nationalist party. But events moved so rapidly during the war and ideas were so radically transformed that the Act passed out of the sphere of practical politics, the growth of Sinn Féin making Home Rule as such a controversy of the past. The provisions of the Government of Ireland Act, 1920, successor to the stillborn Act of 1914, are best studied in relation to the general trend of Irish history itself. See *Eire; Ireland*; Parnell, C. S.; Sinn Féin.

Home Security, MINISTRY OF. British govt. dept. established Sept., 1939, to be responsible for protection of the public and its property during the Second Great War. The Home secretary was minister and eventually assumed control over a wide variety of home front activities, including the direction of Civil Defence (*q.v.*) and the enforcement of Defence Regulations (*q.v.*). The first minister was Sir John Anderson, who was succeeded by Herbert Morrison in Oct., 1940. The ministry ceased to exist with the resignation of Winston Churchill's coalition on May 23, 1945, when its residuary functions were taken over by the Home office (*q.v.*).

Homestead. Term formerly applied to the place of a dwelling-house and the land immediately adjacent; now used specifically of a small agricultural holding. In

countries with large areas of unoccupied territory it is the term applied to tracts of crown or state land granted to settlers for occupation on advantageous terms, and legislation directed towards the encouragement of settlers on such, and securing their homesteads to them by exempting them from the claims of creditors, is comprehensively known as Homestead and Exemption Laws.

The policy was initiated in the U.S.A. in 1862, when a federal Act was passed granting tracts of surveyed and otherwise unappropriated public land not exceeding 160 acres to any head of a family or other approved applicant on condition of his agreeing to occupy and cultivate such settlement continuously for at least five years, reduced in 1912 to three years. To encourage settlers the Act explicitly provided that homesteads so acquired should be immune from alienation from the settler in satisfaction of any debt incurred by him between entering on occupation and securing his final title to the land. Formal registration in a land office and payment of nominal fees constitutes "original entry" of a settler upon his homestead. At the expiration of the three years and upon proof of the continuous occupation and cultivation of the land, the government issues a certificate of title to the person who made the original entry or, if he be dead, to his heirs or assignees. This constitutes the "final entry" and gives perfect title to the homestead. After the First Great War in one year alone 9,000,000 acres in the U.S.A. were patented under homestead laws. Several states have also passed homestead acts, which incidentally confer on the homesteads concerned exemption from seizure for debt—a valuable privilege in times of commercial depression, as in 1929.

The system has been adopted in the British commonwealth. In Canada provincial crown lands are granted to approved applicants over 18 years of age in lots ranging from 160 to 640 acres, and loans are made to the settler upon advantageous terms. Details vary in the different provinces, but generally the conditions require the settler to reside on his homestead for at least 6 months in each of 3 years, to erect a habitable house thereon, to crop at least 20 acres, and to be a British subject. In Australia homesteads are procurable on similar terms. In the British dominions and also in the

U.S.A. special facilities are offered to settlers who have served in the armed forces. See Emigration.

Home, Sweet Home. Song by John Howard Payne (*q.v.*). Originally sung in Payne's opera, *Clari, the Maid of Milan*, produced at Covent Garden, London, May 8, 1823, for which Sir Henry Bishop wrote the music, it has been popular wherever the English language is spoken. It was one of the most effective lyrics in the repertoires of Patti and Melba.

Homicide (Lat. *homo*, man; *caedere*, to kill). In law, the taking of human life. The life must be a separate one. Homicide may be (1) felonious, which is either murder, manslaughter, or suicide; (2) justifiable; or (3) excusable.

Justifiable homicide is where the life is taken in execution of a legal duty. The execution of a criminal is one instance. Another is the killing of a man in order to prevent him from committing a forcible and atrocious crime, provided always that there is no other way of preventing him. A third instance is where an officer of justice, such as a constable or a magistrate, or anyone aiding him, is bound to perform a legal duty, and meets with violent resistance, and to overcome that resistance is obliged to resort to force. If the officer uses no more force than is reasonably necessary to overcome the resistance, he is justified, even if he kills someone. It is on this principle that soldiers who fire on rioters are justified.

Excusable homicide is of two kinds. The most usual is by misadventure, when a man doing a lawful act, by accident and without negligence kills another. For example, a man driving a motor car without negligence runs over and kills a foot passenger. The second kind is self-defence—or, as it is called, *se defendendo*. A man is entitled to use all necessary force in defence of himself, his wife, child, parent, or servant, to meet any attack. But if, after having overcome the attack, he follows up his victory by such violence as to cause death, the homicide is felonious. See *Manslaughter*; *Murder*.

Homildon Hill or Humbledon Hill. Eminence near Wooler, Northumberland, known for the battle fought here between the English and the Scots, Sept. 14, 1402. A Scottish army, having ravaged the northern counties of England, was returning home when it found its road barred by a force collected by the Percys and

other northern lords. The leader of the Scots, the earl of Douglas, arrayed his men on the slopes of the hill, facing the English below. The English archers opened the fight, the Scottish reply being a charge of the men-at-arms down the hill. But this did not reach its goal. The accuracy of the archers was too much for the Scots. Many of the leaders fell, as did hundreds of the rank and file, and before coming to grips with the enemy the army broke and fled. A number of noble Scots were made prisoners.

Homily (Gr. *homilia*, intercourse). Term used formerly for philosophic teaching by means of familiar conversation. In eccles. usage it denoted a familiar discourse on some passage of Scripture—hence homiletics, a term for that branch of theology which treats of sermons and their composition. The earliest extant examples of the Christian homily are those of Origen, which for the most part survive only in Latin.

The Homilies of the Church of England were composed at the time of the Reformation and issued in two books in 1547 and 1563, the contents being appointed to be read in churches on "any Sunday or holy day when there is no sermon." The first book is believed to have been composed by Cramer, Ridley, and Latimer; the second principally by Jewel. They appear to have been put together hurriedly to meet the special needs of the time, to confute heresy, and to assist the imperfectly educated parochial clergy. See *Sermon*.

Hominy (W. Indian). Inner part of the maize berry, coarsely ground. It is less oily than maize meal and lacks the somewhat unpleasant taste of the latter. Porridge is made with it as well as croquettes, fritters, and puddings.

Homo. Latin word for man. Scientifically it is used as the general term for mankind, *i.e.* for the genus of mammals which consists of the various races of man. Sometimes man as a thinking being is distinguished as *Homo sapiens*. See *Anthropology*; *Ethnology*; *Mammal*; *Man*.

Homoeopathy (Gr. *homoios*, like; *pathos*, feeling). System of prescribing drugs based on a special study of their action on healthy persons. The idea of curing "likes" with "likes" is very old; but the scientific investigation of drug action by experiment on the healthy, and the application of the results of this study in the healing of the sick, are due to Samuel Hahnemann

(1755–1843). It was while translating Cullen's *Materia Medica* into German that the idea of testing medicines on himself occurred to him. He was well aware of the curative effect of cinchona bark in cases of intermittent fever, but Cullen's explanation of its action failed to satisfy Hahnemann, and he thought he might gain some information if he took a dose himself when he was quite well. This he did, and experienced a typical access of chill, fever, and sweat.

This came upon him as a revelation. Cinchona bark cured intermittent fever because it had the power of producing an exact image of it in the healthy. But it produced in him a number of other symptoms not specially related to fever; and when cases manifested these, or similar, symptoms, he administered the remedy and cured the cases. For this type of treatment he coined the word *homoeopathy*.

Homoeopathic Dilutions

Hahnemann made the further observation that when a drug and a case of illness were homoeopathically related, the person suffering from the illness was immeasurably more sensitive to the drug's action than when in health, and unless he reduced the dosage in proportion to the troublesome "aggravations" or intensifications of the symptoms were apt to occur. To avoid these he was driven to dilute his remedies more and more, and hence arose his discovery of the power of high infinitesimals, which form one of the best known features of the system.

One result of Hahnemann's discovery was that he was able to use preparations of deadly poisons with perfect safety. Further, he was the first to think of the possibility of using the virus of a disease as a remedy. This is analogous to the principles underlying vaccination, inoculation, and serum treatment. In many ways the discoveries of Hahnemann profoundly influenced medical practice. The chief British homoeopathic institution is the Royal London Homoeopathic Hospital, with 200 beds and a teaching staff. On the Continent, in Australia, in Canada, and in the U.S.A. and S. America, are many institutions of the kind. In the U.S.A. there are fully equipped colleges and universities. Homoeopathy constitutes the acme of individualism in the use of medicine. It treats the basic animal rather than the pathological condition. As no two persons are exactly alike, so no two cases of the same disease are identical,

and each may require a different remedy. Consult *The Principles and Art of Cure by Homoeopathy*, H. A. Roberts, 1943.

Homogamy. Botanical term descriptive of the condition in some flowers, e.g. chickweed, groundsel, in which anthers and stigmas are functionally mature at the same time. This usually results in self-pollination; but the relative positions of anthers and stigmas may make this improbable. The condition in which the two kinds of organ ripen at different times is termed dichogamy.

Homogenising. Process by which all the elements in a substance are evenly diffused throughout it, and prevented from separating out again. Its most familiar use is in the homogenisation of milk. In this the fat is split into small uniform-sized globules by heating the milk and forcing it through small orifices under high pressure. This prevents any cream from rising.

Homogenising is also an important metallurgical process. Many alloys exist in such a form that the composition is not uniform throughout. While this segregation is sometimes useful, e.g. in precipitation hardening, it often becomes necessary to remove or reduce the effect by diffusion. This homogenising entails heating the alloy to a high temperature. See Alloy.

Homologous Series (Gr. *homos*, same; *logos*, ratio, proportion). Term applied in chemistry to any series of organic compounds the terms or members of which preceding or following each other differ by CH_2 , or a multiple thereof. Gerhardt (1816-56) suggested the term owing to the proportional character of the compounds of a series. The general character, constitution, and properties of homologous series are similar. Hence it is possible to give general methods for the preparation of the substances. The gradation in physical properties is in some cases very striking, but generally the lowest of a series is an exception to the rule.

A good example is the specific gravities of the alcohol series—methyl, ethyl, propyl, butyl, amyl, hexyl, heptyl, octyl, and nonyl—in which there is a difference of 0.003 to 0.006 between the various members of the series, from 0.812 for methyl alcohol to 0.842 for nonyl alcohol. The molecular volumes show a still more constant difference. The boiling points rise as the series

ascends, but the difference grows smaller as the molecular weight increases. The melting points and solubilities of homologous series show two groups, distinguishable according to whether the number of carbon atoms is odd or even.

Homology. Morphological term for an affinity of structure. All organs of animals and plants which are based upon a similar morphological or structural type are termed homologous, irrespective of their function. An organ is said to be the homologue of another in a different animal when it conforms to a standard of similar structure. The trunk of an elephant is the homologue of, or homologous to, the nose of other mammals, because both are founded upon the same morphological plan, and its tusks are homologous to the incisor teeth of carnivores.

The forelegs of quadrupeds arise in the same manner in the embryo, and contain essentially the same structures, as do the wings of flying birds. Anatomically they are made in the same way. They are therefore homologous organs, even though they serve the purpose of locomotion in an entirely different way. The arms of a human being are homologous both to the wings of birds and to the fore limbs of quadrupeds, and contain at least some of the same bones. See Analogy; Embryology.

Homonym (Gr. *homos*, same; *onoma*, name). Word which has the same sound or the same spelling as another, but a different meaning. Examples are rite, write, and right; bear (verb), bear (substantive), and bare; fair (adjective), fair (substantive), and fare.

Homoptera. Group of hemipterous insects, or bugs, in which the wings slope over the sides of the body. Fore and hind wings are alike, and the antennae are short. Frog-hoppers, cochineal insects, and greenflies belong to this group.

Homosexuality (Gr. *homos*, same; Lat. *sexualis*, sexual). Term for temperamental condition in which the sexual impulse is directed towards persons of the same sex. It appears to be fundamental in certain individuals, in others to have been induced by psychological maladjustment due to some childhood experience. For the views of psychologists consult e.g. *Sex in Psycho-Analysis*, Jones and Ferenszi; *Outline of Abnormal Psychology*, McDougall; *Collected Papers*, Freud.

Homosexuality between men has been recognized in English law since it was made an offence under

the Criminal Law Amendment Act of 1885; it is in men a ground for divorce. English law does not recognize it between women.

Homospory. Botanical term for the condition in plants which form one kind of spore only, e.g. ferns. In these plants each spore may germinate to produce a bisexual prothallus which bears both male and female reproductive organs (antheridia and archegonia). Horsetails are homosporous, but the prothallus which develops from any one spore is unisexual, bearing either antheridia or archegonia, a condition more usually associated with heterospory.

Homotaxy or **HOMOTAXIS** (Gr. *homos*, same; *taxis*, arrangement). Term used in geology for the similarity of arrangement of fossils in different strata of rocks in different regions. T. H. Huxley thought the finding of similar fossils in two series of rocks in different parts of the globe was no proof that these beds had been deposited at the same time; this challenged an accepted geological axiom. According to modern views, homotaxy seldom if ever occurs. See Fossils.

Homs. A town of Syria, the ancient Emesa. Situated near the Orontes and the lake of Homs, it is about halfway between Damascus on the S. and Aleppo on the N. On the great road from the N. to Egypt, it was a caravan centre in former days; it is now on the Syrian rly., and still does a large trade. Its speciality is the manufacture of gold and silver thread, and it has a large textile industry. It is the seat of a Roman Catholic archbishop. In 272 it was the scene of the defeat of Zenobia, queen of Palmyra, by the Roman emperor Aurelian, and in 1832 of the victory of the Egyptians, under Ibrahim Pasha, over the Turks. During the First Great War it was occupied by the British without resistance, Oct. 15, 1918. During the Second Great War campaign in Syria, Homs was captured from the French Foreign Legion by the Household Cavalry, in July, 1941. Homs gives its name to a Syrian sanjak. Pop. of town, 100,142.

Honan. Interior province of China, in the Yellow River valley. It contains 111 counties, with Kaifeng as its capital. Other important cities are Chengchow, Loyang, Sinyang, Nanyang, and Anyang. The Peking-Hankow rly. runs through the prov. from N. to S., the Lunghai line from E. to W., and the Taoching rly. traverses the N. part. The principal products

are wheat, cotton, sesamum, and coal, the leading coal mines being at Kiaotso and Liuhokou. Honan was the centre of ancient China, Loyang and Kaifeng being two early capitals. Area, 64,545 sq. m. Pop. 31,806,000.

Honan. Town of the prov. of Honan, China. It stands on the river Lo, at the junction of four roads which connect it with the great trade centres in the E., S., and W. It is the terminus of a branch rly. from the Peiping-Hankow main line.

Honda. Town of Colombia, in the dept. of Tolima. It stands on the Magdalena river, near the head of navigation, 65 m. directly N.W. of Bogotá, with which it has rly. communication. From the town to the mouth of the river in the Caribbean Sea is about 600 m. The climate is extremely hot, as the town lies between the Central and Eastern Cordilleras. Honda is a depot for the quinine and tobacco trade of the surrounding districts, and was chartered as a town in 1643. Pop. 13,984.

Hondecoeter, MELCHIOR DE (1636-95). Dutch painter. Born at Utrecht, he studied under his father and J. B. Weenix, his uncle. Devoting himself to pictures of game, poultry, and other birds, alive or dead, he acquired great reputation in this branch of art. His earlier years were passed at The Hague, but about 1668 he was at Amsterdam, where he died April 3, 1695.

Hondo. Main island of Japan. The official name is Honshu (*q.v.*).

Honduras. Republic of Central America. Bounded N. by the Caribbean Sea, S. by Nicaragua and Salvador, and W. by Guatemala, it lies between lat. 13° and 16° N. and long. 83° and 89° W. The coast line on the Atlantic is 400 m. and that on the Pacific about 40 m. There are 17 depts. and one territory. Area, 44,275 sq. m.

Honduras is divided into the Caribbean plains area, lofty inland mountains, and fertile plateaux, being mainly mountainous. Some of the richest and deepest soil in the world is found on the plains and in the many valleys. Human settlements predominate along the sea fronts and in these fertile valleys and plateaux. The highest mts. attain 8,000-10,000 ft.

The Nacaome and Goascoran rivers, discharging into the Pacific,

and the Ulua, Santiago, Chameleón, Patuca, Roman, and Segovia rivers, which empty into the Caribbean Sea, are difficult to navigate, the Santiago being the most useful for transport. Lake Yojoa, 25 m. long by 6 m. wide, is navigable, and by the Blanco river communicates with the Ulua and so with Puerto Cortes on the Atlantic. Other ports are Trujillo, Roatan, and Omoa, with Amapala on the Pacific.

The dominant races are Indian and Spanish, and the republic includes a portion of the once powerful Maya empire, whose descendants are still numerous; while there are remnants of the ancient Carib Indian tribes. Pop. 1,200,542.

Daily Air Services

Honduras has been revolutionised by its war effort. Difficulties of transport have been overcome by aeroplane, nearly every town, and even many villages having daily air service. Railways, mainly owned by two American fruit companies, cover about 660 m. Tegucigalpa, the capital, is connected by road with the Pan-American highway and with San Lorenzo on the Gulf of Fonseca.

Honduras declared itself an independent republic in 1838. Under the 1936 constitution a president and 38 members of a chamber of deputies (one for each 25,000 citizens), the sole legislative body, are elected for six-year terms. The national university is at the capital. Primary education is compulsory. All male citizens must serve three months in the army during their 21st year and remain in the reserve from their 23rd to their 40th year. Spanish is the official language, and Roman Catholicism the dominant faith. The monetary unit is the *lempira*, exchanging (1947) at about 50 American cents.

The country is agricultural, but the Rosario mines still yield over £500,000 of silver and gold annually, while gold washing is carried out by many small companies and individuals. There are rich copper and magnetic iron ores, also coal, antimony, magnesite, cinnabar, and zinc on a small scale. As to exports, the banana accounts for over half the value. Mahogany and other hardwoods used to form a large item of export, and this is being resumed. The country also yields vegetable oils, rubber, citrus fruit, coffee, tobacco, coconuts, vanilla, indigo, sarsaparilla, beans, and rice, while cotton is being raised experiment-

ally. The U.S.A. takes virtually all the exports of Honduras and furnishes four-fifths of her imports.

The climate is healthy on the plateaux, but fever is rife in the lowlands. The scenery is enormously varied, ranging from deep tropical jungles of the coast through dense, giant inland forests, strewn with superb wild flowers, until one emerges on to the bleak, jagged, and barren peaks. The fauna includes jaguar, puma, ocelot, coyote, deer, monkeys, opossum, armadillo, tapir, peccary, and ant-eaters. Birds of gorgeous plumage abound. Alligators infest the rivers, and snakes, tarantulas, centipedes, and scorpions are common.

Architecture varies from palm-thatch, adobe, and log cabins to classical Castilian mansions and modern American homes and tall office buildings. Wagons drawn by bullocks, lines of pack mules, and heavily burdened peons with shoulder packs jostle beside motor cars. The people are gay and hospitable.

Landings of Early Explorers

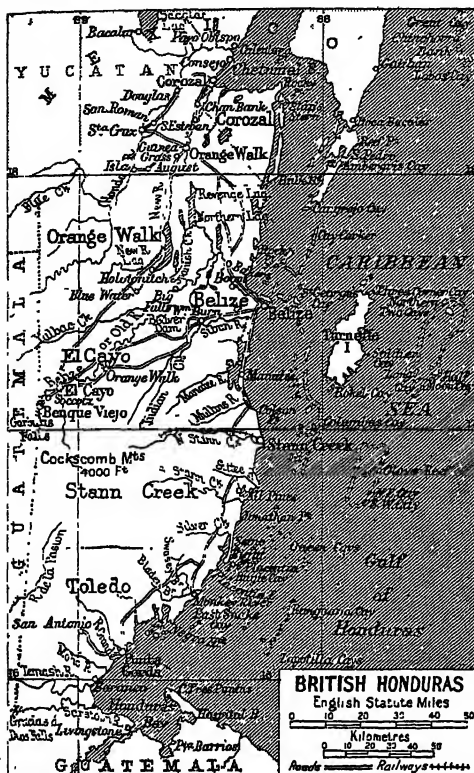

The spot where Columbus first set foot on the mainland of the New World in 1502 is now in Honduras. In 1522 Gil Gonzalez Davila, starting from Panama, landed in Honduras and subdued the Indians. In 1525 came Cortes, who founded a town near the present Puerto Cortes, and spent a year exploring and collecting gold. Conflicts continued between the *conquistadores* until the government of Central America was firmly established in 1543 with Guatemala City as its capital. With the rest of Central America, Honduras achieved independence from Spain in 1821 and was a member of the Central American Federation until 1838. There have been intermittent attempts to establish a new union. The heritage of the country goes back to early Maya times; only 45 minutes by air from Tegucigalpa is Copan (*q.v.*), the ancient Maya capital, often called the Athens of America. In July, 1918, Honduras declared war on Germany, and in Dec., 1941, on the Axis. Consult Honduras, G. B. Reyna, 1930.

Grenville Holmes

Honduras, BRITISH. A crown colony of Central America, on the Caribbean Sea. It lies S. of Yucatan in Mexico, and 662 m. due W. of Jamaica, with an area of 8,867 sq. m., slightly larger than Wales. The Honda river forms its boundary on the N., and the Sarstoon river on the S. The sur-

Honduras arms

British Honduras. Map of the crown colony in Central America on the Caribbean Sea

face in the coastal districts is low-lying and swampy, and numerous small islands and cays lie off the shore; the mountain slopes in the W. and S. are covered with vast forests, abounding in valuable furniture woods and dyewoods. The only river of importance is the Belize, which is navigable for vessels of light draught. The climate is hot, humid, and rather unhealthy. Flora and fauna are like those of Honduras (v.s.).

The chief exports are cedar, mahogany, logwood, bananas, sponges, citrus fruits, and cacao, and there is a large transit trade with American and other ports. Coffee and plantains are cultivated, and stock-raising is carried on.

The first settlers were probably woodcutters from Jamaica about 1638. In 1786 the British government appointed a superintendent, and in 1862 British Honduras was declared a colony, subordinate to Jamaica. It became independent in 1884. The governor is assisted

Honduras, GULF OF. Wide inlet of the Caribbean Sea, between Honduras, Guatemala, British Honduras, and Yucatan, Mexico. It contains Turneffe and Bay Islands, besides many islets, reefs, and rocks. From the island of Cozumel off the coast of Yucatan, to the mouth of the river Patuca at the E. of Honduras, the distance is about 380 m. The inlet sweeps inland about 250 m., terminating in the Gulf of Amatique, which forms an extension at its head. The gulf receives the waters of the Motagua and numerous other rivers.

Hone, WILLIAM (1780-1842). A British bookseller and author. Born at Bath, June 3, 1780, he was a lawyer's clerk at 10, and in 1800 opened a book and print-selling business in London, which failed. He started *The Traveller* in 1815 and *The Reformer's Register* in

William Hone, British author
After Patten

1817. He wrote successful political satires, but his parody of the *Prayer Book* in these involved him in three trials for blasphemy, 1817, his acquittal being followed by a public subscription of £3,000. The *Political House* that Jack Built, 1819, ran through 54 editions.

Hone's other works include *The Apocryphal New Testament*, 1820; *Ancient Mysteries Described*, 1823, dealing largely with the old miracle plays; *Every-day Book*, *Table Book*, and *Year Book*, issued serially, 1826-27, volumes still valued by antiquaries; and *Facetiae and Miscellanies*, 1827. The *Every-day Book* was finished, and its two successors composed, in a debtors' prison. He edited *Strutt's Sports and Pastimes*, 1830. For a time he was landlord of a coffee-house in Gracechurch Street. Converted by Edward Irving, he became an occasional preacher. He was a friend of Lamb, and worked hard for the freedom of the press and the promotion of cheap literature. Died Nov. 6, 1842. *Consult* *Life and Times*, F. W. Hackwood, 1912.

Honegger, ARTHUR (b. 1892). Swiss composer. Born at Havre, March 10, 1892, he studied at the Zürich and Paris conservatoires. Hethen settled in France, and his first important work, a sonata for violin and piano, appeared in 1916. Two years later

Arthur Honegger, Swiss composer

a large scale work, *Le Dit des Jeux du Monde*, fully revealed his individuality. During the 1920s he was one of the leaders of Les Six. He remained in Paris during the Second Great War, but was teaching in the U.S.A. in 1947. Honegger's compositions inclined towards tragic subjects, austere forms, and harsh polytonality. His works include four symphonies; *Pacific 231* (descriptive of a locomotive); incidental music to Gide's *Saul*; an oratorio, *St. Joan at the Stake*; piano and organ pieces, songs, and music for films.

Honesty (*Lunaria annua*). Annual or biennial herb of the family Cruciferae. It is a native of Europe, and has heart-shaped, toothed leaves, and terminal sprays of lilac flowers. The seed-vessels are flattened out to a broad oval-oblong disk, from which, when ripe, the two valves fall off, leaving the seeds attached to a

Honesty. Left, stalk with foliage and flowers. Right, seed-vessels

thin, silvery partition. They are then dried and used for decorations, as "everlastings."

Honey. Semi-fluid substance produced by certain species of bees for the nourishment of their larvae. In general use it refers to that produced by the domesticated hive or honey-bee (*Apis mellifica*), which obtains as raw material the nectar of flowers, carrying it in the honey-crops, where it is acted upon by a ferment which modifies its character. When the crop is full the bee returns to the hive and regurgitates the contents. To equalise the supply of food to the community the honey is stored in the waxen cells of the combs prepared for the purpose; and to encourage the bees to collect a surplus vastly in excess of their own needs, the beekeeper removes the combs as they are filled and substitutes empty sections.

Honey consists chiefly of levulose and dextrose, the former being the fluid portion. Its flavour depends to some extent upon the flowers that have been visited when that particular section of comb was being filled. Sometimes it is rendered black and unwholesome through the bees collecting the so-called honey-dew, which is really the excrement of aphides. Fresh honey should be of a bright straw-colour, and have a pleasant, delicate flavour and aroma. This is a valuable food, as it represents "natural" sugar. See Bee.

Honeyberry. Fruit of the nettle-tree (*Celtis australis*). Belonging to the family Ulmaceae, it is a native of the Mediterranean region. The blackish fruit resembles a wild cherry, and when ripe (in winter) is very sweet. See Nettle-tree.

Honey Buzzard (*Pernis apivorus*). Species of falcon common on the continent of Europe and occasionally seen in Great Britain during summer. The plumage is usually grey and brown on the upper parts with white below, and the

adult bird is 25 ins. long. It gets its name from attacking the nests of wild bees and wasps in order to feed upon the grubs. It also eats other insects, slugs, worms, and birds' eggs.

Honeycomb. Series of waxen cells made by bees to store their honey and pollen, and to contain their brood. The comb, as a whole, consists of double rows of hexagonal cells fixed at right angles to the comb base. The hexagonal shape of the cells is exactly the shape which provides the maximum of space with the minimum of material. Advantage has been taken of the fact by modern beekeepers to provide an hexagonally

Honeycomb. Series of hexagonal waxen cells from a wild hive

impressed wax foundation for bees to build on. The wax sheets are made by special roller presses. Each worker bee cell is about $\frac{1}{4}$ -in. in diameter, the cells for drones and queens (royal cells) being slightly larger. See Bee.

Honeycomb Moth. This insect is more correctly known as Wax Moth (*g.v.*).

Honey-Dew. The sweet, sticky excreta of plant lice and some scale insects. Often voided on to the stems and leaves of plants, it is sought after by ants, which frequently abound on vegetation infested with these insects. Honey-dew from the scale insect *Trabutina mannipara*, which feeds on tamarisk in Sinai, is called

Honey Buzzard. Specimen of the European falcon occasionally seen in Britain

manna and is eaten by the Arabs. It is thought to be the manna mentioned in Exodus. See Aphis.

Honey-Eater. Name given to the various species of Australasian birds included in the family Meliphagidae (*G.r. meli*, honey; *phagein* to eat). The largest being the size of a thrush, they have beautiful plumage and notably long curved beaks and cleft tongues. They feed on insects and nectar, extracting it from the deep flowers with their long tongues. Their plumage is greatly in demand for purposes of dress ornament.

Honeymoon. Name given to the first month after marriage, and therefore to the period spent by the pair as a holiday. Its origin is uncertain. See Marriage.

Honestone. Mineral more generally known as Mellite (*g.v.*).

Honeysuckle. Graceful climbing shrub of the family Capri-

Honey-Eater. Specimen of Parson Bird or Pō honey-eater W. S. Burridge, F.Z.S.

Honeysuckle. Flower of *Lonicera periclymenum*

foliaceae, genus *Lonicera*. It has fragrant, tubular flowers of white, yellow, and all shades from rose to crimson, with the corolla generally two-lipped. The leaves are smooth and opposite, and the fruit is a small, red, single-seeded berry. Known in many parts of the country as woodbine, one kind is a native of Great Britain, while others have been introduced from various parts of the N. hemisphere. They thrive best in a fairly light loam and a sunny position. See Flower.

Honfleur. Seaport of France, in the dept. of Calvados, lying on the S. side of the Seine estuary, nearly opposite Havre. The town has many timbered houses, and

the wooden church of S. Catherine is noted for its two naves set side by side. Overlooking the town on the W. is the chapel of Notre Dame de Grâce, a favourite shrine of pilgrimage for sailors, which is said to have been founded in 1034.

Honfleur was taken by Edward III in 1346, and during the Hundred Years' War it changed hands several times until the English were expelled and it was finally taken by Charles VII in 1440. It was occupied by the Germans in June, 1940, and liberated by British airborne troops Aug. 25, 1944.

Hong-Kiang OR RED RIVER. River of S.E. Asia. Rising in the N.W. of the Chinese prov. of Yunnan and flowing into the Gulf of Tongking by a delta, it is 500 m. long, and navigable for about half its length, i.e. to Manhao. Its valley contains part of the rly. from Yunnanfu to Hanoi.

Hong Kong. Island off the coast of Kwangtung prov., China. It lies at the entrance to the

Hong Kong. 1. Looking north from Victoria Peak across the fine quay-side buildings and harbour to Kowloon, on the mainland. 2. Stepped street in the Chinese quarter. 3. Des Voeux Road, the main street in the European city

Hong Kong arms

Canton river, and was ceded to Great Britain in 1841. Besides the island, which is 11 m. long and from 2 m. to 5 m. wide, the colony includes Kowloon, a strip of territory on the mainland ceded in 1860. To this was added in 1898, under lease for 99 years, the peninsula S. of a line drawn between Deep Bay and Mirs Bay, together with the islands of Lantow and Lamma, the district being known as the New Territories. The concession covers an area of 391 sq. m., including the island of Hong Kong, 32 sq. m., and has a pop. of about 1,800,000, most of whom are Chinese.

Before 1839 the island of Hong Kong was merely a resort of Chinese fishermen. In that year the English traders came there from Canton.

An affray on the island in July, in which a Chinese was killed by some British sailors, led to war. The British expedition used Hong Kong as its base, and formally took possession of the island in Jan., 1841, the cession being confirmed by the treaty of Nanking, 1842; the charter bore the date April 5, 1843.

The site chosen for settlement was on the N. coast of the island, and the first sale of land took place in June, 1841. The city called Victoria, now stretches 4 m. W. to E. along a narrow strip of land between the hills and the sea. Hong Kong is in normal times the distributing centre for one-fourth to one-third of China's foreign trade. The harbour, of which a

magnificent view is obtained from Victoria Peak, a hill used as a residential quarter, is one of the finest in the world. Local industries include shipbuilding, the making of rope, cement, textiles, paints, silver and metal wares, and deep sea fishing. Kowloon is the main industrial area, and has rly. connexion with Hankow and Canton; there are an airfield and flying-boat base on the mainland.

Hong Kong, created a crown colony in 1843, is administered by a governor, assisted by an executive council and a legislative council. There is also a municipal council, with power to make bye-laws.

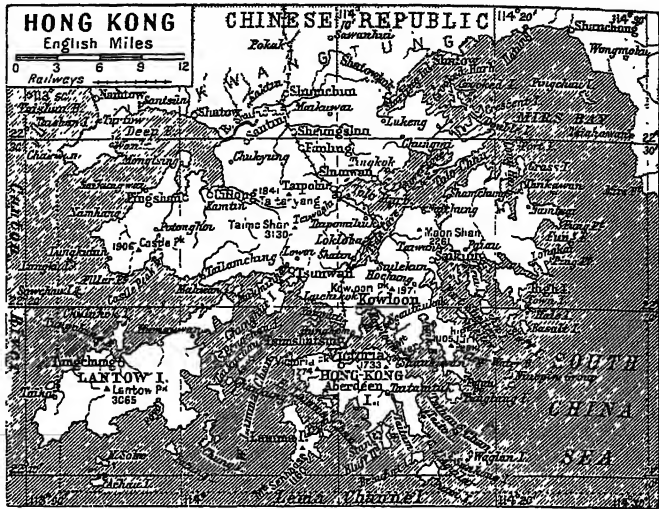

On December 8, 1941, following the outbreak of war, two Japanese divisions, supported by dive

bombers, launched an attack on the colony from the landward side. Strong pressure necessitated the withdrawal of British forces at Kowloon to Hong Kong on the night of Dec. 11-12. A demand of surrender was refused, and there followed three days of intense air, naval, and artillery bombardment, followed by a second ultimatum, which was also rejected. On Dec. 18, Japanese forces crossed the strait separating the island from the mainland, and by the 22nd the defenders were split into isolated groups lacking supplies, ammunition, and water. Outnumbered five to one, the garrison surrendered on Christmas Day. (*Consult* Maj.-Gen. C. M. Maltby's official dispatch, pub. 1948.)

The Japanese occupation terminated on Aug. 30, 1945, when a powerful British naval force entered the harbour. Hong Kong had been badly damaged, many public buildings, including the university, being in ruins; while the results of thirty years of afforestation had been destroyed. The formal Japanese surrender was made at Government House on Sept. 16.

After the war, Hong Kong suffered an acute shortage of houses and food, while there was an influx of Chinese seeking refuge from the disturbed mainland. Reconstruction, however, was rapid; the harbour was quickly repaired, and the fishing and other industries restarted. The U.K. allocated £3,250,000 for reconstruction, as well as £1,000,000 under the Colonial Development and Welfare Act. By 1949 the colony was again the most prosperous place in the Far East.

Hong Kong, UNIVERSITY OF. British university founded in 1911. Its nucleus was a college of medicine, and it was opened in

Hong Kong. Map of the important British crown colony on the coast of China, showing the island, and Kowloon and the New Territories on the mainland

1912, Sir Charles Eliot being the first president. There were faculties of medicine, engineering, science, and arts. The buildings were destroyed in the Second Great War, but the university was reopened soon after, the U.K. granting £250,000.

Hong Kong and Shanghai Bank. British banking corporation. It was established in 1866 by an ordinance of the legislative council of Hong Kong. The headquarters are in Hong Kong, and it has branches in many places in China, the Straits, the Far East, also in Bombay, Calcutta, Colombo, New York, San Francisco, and Lyons. The London offices are at 9, Gracechurch St., E.C., and the paid-up capital is 20,000,000 H.K. dollars.

Honi soit qui mal y pense (O.F., Shame be to him who thinks evil). Motto of the most noble order of the Garter (q.v.).

According to tradition, the words were uttered by Edward III when he picked up a garter accidentally dropped at a court ball by the countess of Salisbury, and buckled it below his own knee, subsequently instituting the order. This motto is embroidered in gold on the garter badge of the order, which surrounds the coat of arms of the British sovereign.

Honister Pass. Road in Cumberland, England, connecting Sealtoller in Borrowdale (E.) with Buttermere (W.). Rising for 1½ m. to an alt. of 1,190 ft., it is flanked by Honister Crag, 1,750 ft., whose face is scarred by slate quarrying. The forbidding grandeur of this place is described in Hugh Walpole's novel, *Rogue Herries*.

Honiton. Mun. bor. and market town of Devon, England. It stands near the Otter, 16 m. E.N.E. of Exeter, with a rly. station. The wide main street is of Roman origin. Since the reign of Elizabeth, Honiton has been celebrated for lace-making, an industry introduced by the Flemings; there are also light engineering and pottery works and a cattle market. The bor. council maintains the water supply. Honiton gives its name to a co. constituency. A three days' fair, dating back to 1221, is held on the feast of S. Margaret, July 20. Market day, Sat. Pop. 3,008.

Honolulu. City, seaport, and capital of the U.S. territory of Hawaii, in the Pacific, centre of the trans-Pacific routes. On the S. coast of Oahu Island, it is a modern city with electric lighting and tramways and well planned thoroughfares lined with tropical

Honolulu. Air view of the capital of Hawaii; in the distance is Diamond Head, an extinct volcano, with the famous Waikiki Beach at its base

fruit trees and ablaze with bougainvillea and hibiscus. A rly. extends N. round the greater part of the island coast. The city contains good hotels and clubs; Waikiki beach is visited by holiday-makers from all over the world. The climate is both healthy and temperate. The see of an Anglican and an R.C. bishopric, Honolulu is the seat of the university of Hawaii; other buildings include the former royal palace, the government building, and the Bishop museum. There is a good natural harbour, and the airport is a staging point for air liners bound for N. and S. America, Asia, and Australia.

Honolulu has factories for machinery and a small ship-building industry. Seven miles S.W. is Pearl Harbour (q.v.); during the Japanese raid on Dec. 7, 1941, Honolulu was also bombed. The military post of Schofield Barracks is 20 m. W., and the headquarters of the U.S. army in Hawaii is near by. An unpretentious village until its fortification in 1815, the city and co. of Honolulu were formed from the co. of Oahu in 1909, being then granted municipal rights. Estimated pop., 261,023, with a majority of Poly-nesian, Chinese, and Japanese.

Honorary Rank. Rank in the army which confers no advantages as regards pay, retirement, or pension. Up to 1918 it was granted to quartermasters and similar officers in the army while serving. During the Great Wars civilians were given honorary service rank while attached to formations for the performance of special services. Officers when demobilised were usually granted an honorary rank and could use it in civilian life if they wished.

Honorina. Sister of Valentinian III, Western Roman emperor 425-455. When Attila, the Hun, was threatening to overrun the empire, she sent him an offer of marriage. Attila expressed his willingness to accept the proposal, but demanded half of the western empire as her dowry. The refusal of this demand led to the crossing of the Rhine with a large force. See Attila.

Honorius, FLAVIUS. Roman emperor of the West, 395-423. He was the second son of Theodosius the Great and brother of Arcadius, emperor of the East. He was placed by the terms of his father's will under the guardianship of the Vandal Stilicho, whose daughter Maria he married. During the reign of Honorius dismemberment of the empire by the barbarians

made rapid progress. Britain secured virtual independence, the Vandals settled in Spain, while

Honorius, Roman emperor
From a coin

Gaul was occupied by the Visigoths, Franks, and Burgundians. While his distinguished general Stilicho was alive they were kept at bay by fighting or by negotiation, but after Stilicho had been put to death in 408, as the result of an intrigue against him, in 410 Alaric, king of the Visigoths, took and sacked Rome, 800 years after it had been taken and sacked by the Gauls. After the death of Stilicho, Honorius found another capable general in the person of Constantius, who became the colleague of the emperor and in 417 married his sister Placidia, being afterwards proclaimed joint-emperor. Honorius, who was quite unfitted to rule, spent most of his time in poultry-breeding in the marshes of Ravenna, where he died Aug. 27, 423.

Honorius. Name of four popes, of whom two are noticed separately. Honorius II, pope 1124-30, was an archdeacon of Bologna and cardinal. His election was forcibly demanded by the Frangipani family. While holding the office of cardinal-bishop of Ostia, he concluded the concordat of Worms, 1122, with Henry V. Honorius IV belonged to the noble Roman family of Savelli. He was 75 when elected pope in 1285, and died two years later.

Honorius I (d. 638). Pope 625-638. A native of the Campagna and a monk, he was consecrated pope in succession to Boniface V. He was notable for his condemnation as a heretic by the sixth general council (Constantinople, 680-681), which put an end to the Monothelite heresy and anathematised its adherents. Sergius, patriarch of Constantinople, condemned by the same council, had referred the controversy to the pope for guidance. Honorius refrained in his answer from making any dogmatic assertion, but advocated rather a policy of caution. His heresy consisted in evading the duty of declaring the faith of the Church.

The question of this condemnation of a pope for heresy was raised at the time of the Vatican Council (1870) which promulgated the decree of Papal Infallibility;

the difficulty was met by the agreement that the pope's letter did not constitute an *ex cathedra* utterance, which alone is the subject matter of infallible judgement. It was by this pope's advice that S. Birinus evangelised the kingdom of the W. Saxons, and the Irish bishops, in 630, adopted the Roman use in the time of keeping Easter.

Honorius III (d. 1227). Pope 1216-27. His name was Cencio Savelli, and he was born at Rome. After being a canon and papal chamberlain, 1188, he was made a cardinal in 1193, and in 1197 was appointed tutor to the young king Frederick II. He ascended the papal throne in 1216 and the rupture between the Papacy and the Empire was staved off during his lifetime. Honorius was zealous for the spiritual reform of Europe and the recovery of Jerusalem, but the policy of Frederick II wrecked the Fifth Crusade, furthered with all the means in his power by the pope.

In England, Honorius championed the infant Henry III against the barons who would have deprived him of the crown, and throughout the boy-king's minority the pope's influence was maintained through his legates. In face of a rebellion he was forced to retire from Rome in 1219, and again in 1225, owing to the quarrel between the Conti and Savelli families. Honorius was an ardent supporter of the new religious orders springing up, and issued Bulls approving the Dominicans, 1216, the Franciscans, 1223, and the Carmelite Order, 1226. Among other saints he canonised S. Hugh of Lincoln. Distinguished for personal learning, he left behind literary remains of considerable interest and importance, and it was by his order that the collection of decretals known as the *Compilatio Quinta* was drawn up. He died at Rome, March 18, 1227.

Honor Oak. Residential dist. and park in the S.E. suburbs of London. It is in the metropolitan borough of Lewisham, and has two rly. stations. It is 6 m. S.S.E. of London Bridge. Known also as Oak of Honour Hill and One Tree Hill, the height here (300 ft.) is perhaps named from an oak under which Queen Elizabeth is said to have dined. The old ceremony of beating the bounds used to be observed here. The hill, once employed as a beacon and semaphore station, became public property in 1905.

Honour. Name given in the Middle Ages to a large estate held

by one lord. It consisted of two or more manors, which, however, retained their separate organizations. It did not, like a barony or an earldom, give its owner a specific title; he was known merely as the lord of the honour, and the grant of honours by the kings was not very frequent. One of the largest and most famous honours in England was that of Clare. See Feudalism; Manor.

Honourable. Title of honour. In the U.K. it is applied to the younger sons of earls and to the children of viscounts, barons, and life peers, to maids of honour, the lord provost of Glasgow, justices of the high court except lords justices and lords of appeal, members of the house of commons collectively and individually, to some colonial officials, and to the Honourable Artillery Company, the Inns of Court, and the Irish Society. Earls, viscounts, barons, privy councillors, lord mayors, the lord provost of Edinburgh, lords justices, and lords of appeal are "right honourable." Marquesses, and the privy council and the Order of the Bath collectively, are "most honourable." In Australia, Canada, and other parts of the Commonwealth the prefix honourable is borne, during their term of office, by members of the legislatures and judges, as well as by ministers of the crown. In the U.S.A. "honourable" is applied to members of congress and state legislatures, judges, etc.

Honourable Artillery Company. British regiment. It dates from 1537, when Henry VIII gave some of London's citizens, called the Fraternity or Guild of Artillery, a charter directing them to encourage the "science and feat of shooting long bowes, cross-bowes and hand-gonnes for the better defence of the realm." In 1641 the company obtained the training ground near Bunhill Fields, which it still holds. In that year the prince of Wales (afterwards Charles II) joined it, and since then either the king or prince of Wales has almost always held command of the company as Captain-General.

Honourable Artillery Company arms

Artillery (in the modern sense) was not added until 1781. Four H.A.C. members who emigrated founded in 1638 the Ancient and Honorable Artillery Company of

Massachusetts, with headquarters at Boston. This is the oldest surviving military body in the New World.

In the S. African War, the regiment provided all the officers and 90 p.c. of other ranks for the City

Honourable Artillery Company badge

Imperial Volunteer battery, as well as detachments of infantry and mounted infantry. Two H.A.C. infantry battalions and five Royal Horse Artillery batteries fought with distinction in the First Great War—in France, Egypt, Aden, Palestine, and Italy. The battle honours included Ypres, 1915, '17; Somme, 1916, '18; Ancre, 1916; Arras, 1917, '18; Bullecourt; Passchendaele; France and Flanders, 1914–18; Vittorio Veneto; Gaza; Jerusalem.

As part of the Territorial Army, the regiment built up a large reserve of trained infantrymen and gunners, most of its members being drawn from the City of London. On the outbreak of the Second Great War, the infantry battalion became an O.C.T.U. The R.H.A. batteries were soon expanded to form two complete regiments—11th and 12th; later the 13th regiment was added. Between them, these units fought in Libya, Tunisia, Sicily, Italy, Normandy, and N. W. Europe. The guns of the 11th H.A.C., landed at Pachino, Sicily, on July 10, 1943, were the first British artillery to go into action in the Allied invasion of Europe from N. Africa. The 86th Heavy A.A. Regiment, formed in 1939, played a great part in home defence and later in France and Belgium. It landed in Normandy on D-day, and defended Antwerp against flying bombs. Other H.A.C. units were a national defence company and a cadet battalion.

Among the privileges of the H.A.C. are the wearing of similar dress uniform to that of the Grenadier Guards (the gold lace being replaced by silver); the provision of a guard of honour when royalty visits the City; and the right to march through the streets of the City "with bayonets fixed, colours flying, and drums beating." In 1938, following the fourth centenary celebrations, the H.A.C. was selected to mount the first guard by a non-regular unit

at Buckingham Palace. The headquarters are at Armoury House, City Road, E.C.1. The building dates from 1735, and contains regimental relics. Consult History of the Honourable Artillery Company, G. Gould Walker, 1926.

Honshu or **HONDO.** Largest island of Japan, known also as Mainland. It is separated from Hokkaido on the N. by the Tsugaru Strait, and from Shikoku and Kyushu on the S. by the Inland Sea, and has a coast-line of over 4,700 m. Including 382 adjacent small islands, its area is 88,919 sq. m. It is crescent-shaped and about 800 m. in length from N.E. to S.W., while its maximum breadth is c. 250 m. Its shores are broken by numerous bays, and in the S. it is fringed by numerous islands. The chief inlets are Rikuoku bay in the N., Toyama and Wakasa bays on the W., and Owari, Suruga, and Tokyo bays on the E.

The mountains belong to three systems. In the centre the Fuji group crosses the island from E. to W., this section being variously known as the Japanese Alps or the Sierra Nevada of Japan. Many of the peaks are volcanic in origin. Fuji itself is probably the most perfect volcanic cone in the world; Oshima is still active, and there are traces of former glaciers. In the N., in the Kwanto district, comparatively low and rounded peaks stretch in undulations as part of the Sakhalien mt. system; in the S., in Kwansai, higher and more rugged peaks connect with those of Korea and Central Asia.

In the S. part of the island is the celebrated lake of Biwa, an object of superstitious awe; other lakes are Shinji in the S.W., Inawashiro in the centre, and Towado in the N. The numerous rivers are all short, and rarely navigable far inland. Earthquakes are prevalent, and often destructive, as in 1923. Towards the close of the summer typhoons frequently occur. The climate is on the average warmer than that of England, with twice its annual range of temperature. There is a definite rainy season at midsummer, and much snow during the winter. Rainfall is so heavy that there is little grass land, the natural vegetation being forest. The island is the most densely populated in the country.

The capital is Tokyo; other large towns and ports are Yokohama, Kyoto, Hiroshima, Kobe, Osaka, and Nagoya. Exports in the 1930s were rice, silk, tea, barley, rye, matting, oil, lacquered ware,

earthenware, paper, and coal. The minerals include gold, silver, copper, lead, and iron. Fishing is engaged in on the coasts, and salmon and trout may be caught in fresh-water lakes and streams. In the forests are oak, beech, maple, elm, pine, and cedar. Various fruits are cultivated, the cherry and plum mainly for their blossoms.

Honthorst, GERARD VAN (1590–1656). Dutch painter. Born at Utrecht, Nov. 4, 1590, he studied

Gerard van Honthorst,
Dutch painter
Self-portrait

Besides carrying out decorations at The Hague and Ryswick, he received important commissions from the kings of Denmark and Prussia. His earlier work was largely inspired by Caravaggio. In his last years he virtually confined himself to portraiture. He died at Utrecht, April 27, 1656. *See* Craven, Earl of, illus.

Hooch, PIETER DE (c. 1632–81). Dutch painter. Born at Rotterdam, he appears to have spent part of his life at Delft, and the rest at Amsterdam and Haarlem. He knew Nicholas Berchem (*q.v.*) at Delft, and possibly worked under him. De Hooch is outstanding among the Dutch painters of everyday scenes in houses and courtyards. His composition and drawing are masterly, his treatment of detail unusually thorough, and his colour cool, luminous, and brilliantly luxurious. There are fine examples of his art in the National Gallery, London, the Wallace Collection, London,

and the Rijks Museum, Amsterdam. He died at Haarlem.

Hood (A.S. *hōd*; cf. Eng. hat). Originally a covering for the head, but now mainly an addition to an academic robe. In England in the Middle Ages it was worn by men and women, rich and poor alike, until in the 15th century its place was taken by the hat. The commonest form of hood fitted close about the head, neck, and shoulders. This had a tippet or liripipe hanging at the back, which remained a factor in head-dress after the hood itself had been discarded. Vestiges of this survive in ceremonial dress, while hoods are often worn by women and children in wet weather. In falconry a hood was used to cover the eyes of the hawk, and from this we have the word hoodwink.

As an addition to an academic robe, the hood indicates the academic rank of the wearer. By the 58th canon every minister when officiating in church, if a graduate, is required to wear over his surplice the hood proper to his degree. Receivers of Lambeth degrees wear the hood of such degrees as are worn at the university of the archbishop who gives them. Distinctive hoods have been adopted also by various theological colleges. The Oxford shape is an enlarged cowl; the Cambridge includes a cowl upon the tippet. Examples of university hoods are

Oxford.—B.A., black silk, lined white fur; M.A., black silk, lined crimson; B.D., black silk, plain; D.C.L., scarlet cloth, lined pink silk; D.Mus., white broadened silk, lined crimson silk; D.D., scarlet cloth, lined black silk; D.Litt. and D.Sc., scarlet cloth, lined neutral grey silk; D. Phil., scarlet cloth, lined dark blue silk; M.Ch., black silk, lined light blue silk.

Cambridge.—B.A., black silk, trimmed white fur; M.A., black silk, lined white silk; B.D., black silk; D.D., scarlet cloth, lined pink and violet shot silk; LL.D., scarlet cloth, lined light cherry-coloured silk; Mus. D., damasked cream white silk, lined dark, cherry-coloured satin.

London.—B.A., black silk or stuff, edged russet-brown silk; LL.B., black silk or stuff, edged blue silk; M.A., black corded silk, lined russet-brown silk; M.Sc., black corded silk, lined gold silk; M.D., scarlet cloth, lined purple silk; D.Mus., scarlet cloth, lined white watered silk; D.Sc., scarlet cloth, lined gold silk; D.D., scarlet cloth, lined sarum red silk.

Durham.—B.A. black stuff, bound with white fur; M.A., black silk, lined purple; B.D., black silk.

Edinburgh.—M.A., black silk, lined white silk; B.D., black silk, lined purple silk, bordered with white fur; D.D., black cloth, lined purple silk; Mus. D., scarlet cloth, lined white corded silk.

See Degree; Gown, colour plate.

Hood. British battle cruiser sunk on May 24, 1941, by the German battleship *Bismarck* (*q.v.*). Completed in 1920, the *Hood* displaced 42,100 tons on a length of 860 ft. 7 ins., a beam of 105 ft. 2 ins., and a draught of 31 ft. 6 ins. Her engines developed 144,000 s.h.p. to give a maximum speed of 31 knots. Main armament consisted of eight 15-in. guns and there were secondary batteries of twelve 5.5-in. and eight 4-in. A.A. guns. The *Hood* cost £6,025,000 and was for many years the largest and most powerful warship in the world. She was extensively refitted in 1929–30, when much additional armour was worked into the hull and the A.A. armament was increased, raising the tonnage to 46,300.

At the outbreak of the Second Great War, the *Hood* was flagship of the battle cruiser squadron, Atlantic Fleet. On July 3, 1940, she took part in the action against French ships at Oran, and on July 9 carried out an offensive sweep in the Mediterranean with the *Ark Royal* (*q.v.*). When the German battleship *Bismarck* and heavy cruiser *Prinz Eugen* sailed from Bergen as commerce raiders the *Hood* and the battleship *Prince of Wales* were detailed to intercept them. Contact was made off the coast of Greenland early on May 24, and after an exchange of fire the *Bismarck* scored a direct hit on the *Hood's* main magazine. A colossal explosion tore the ship to shreds, and she went down in a

Hooch. Typical interior by the Dutch painter Pieter de Hooch, a masterpiece now to be seen in the Wallace Collection, London

H.M.S. Hood. British battle cruiser, completed in 1920 and sunk by the German battleship Bismark, May 24, 1941

few minutes. There were fewer than a dozen survivors from her crew of 1,418. German documents captured later revealed that the Hood had been picked up by the German equivalent of radar and sunk at a range of 13 m.

Hood. Summit of the Cascade Mts., Oregon, U.S.A. It is situated 50 m. E. of Portland, and is an almost extinct volcano 11,934 ft. high, exhibiting feeble signs of its former activity. In 1907 a fumeroles melted much glacier ice.

Hood, SAMUEL, 1st Viscount (1724-1816). British sailor. Born Dec. 12, 1724, he entered the navy in 1741. After seeing service in America and off the coast of Spain, in 1759 he commanded the Vestal frigate under Rodney in the blockade of the French coast, and was afterwards dispatched to the Mediterranean. In 1767 he was commander-in-chief in N. America, where he remained until 1771. Commissioner of Portsmouth and governor of the naval academy, he was made a baronet in 1778, became rear-admiral in 1780, and was dispatched in command of a squadron to the W. Indies to reinforce Rodney. After several minor engagements with the French he sailed for N. America, where he vainly attempted to prevent the French admiral, De Grasse, from blockading the Chesapeake, 1781.

Having returned to the W. Indies, Hood made a vain attempt to eject the French from St. Kitts. Serving with Rodney, he took part in the victorious action off Dominica, April 9 and 12, 1782. Made an Irish baron on his return, Sept. 12, 1782, he was M.P. for Westminster in 1784, commander-in-chief

Hospital, holding the post until his death, Jan. 27, 1816.

Hood, BASIL WILLETT CHARLES (1864-1917). British dramatist. Born April 5, 1864, he was educated at Wellington and Sandhurst, and was in the army 1883-98. He wrote much for the stage, chiefly light comedies and the librettos for musical plays, e.g. *The Rose of Persia*, 1900; *Merrie England*, 1902; *A Princess of Kensington*, 1903; *The Merry Widow*, 1907; and *The Dollar Princess*, 1909, the last two being adaptations. He died Sept. 7, 1917.

Hood, SIR SAMUEL (1762-1814). British sailor. Born Nov. 27, 1762, of a naval family, he entered the service in 1776, and fought at the battle off Ushant, 1778. In 1780 he sailed to the W. Indies under his cousin, the future Lord Hood, was promoted lieutenant, and fought in actions off Martinique and Cape Henry, St. Kitts and Dominica. In 1790 he took the frigate Juno to Jamaica, where he saved three men from a wreck. In 1793 he served in the Mediterranean under Lord Hood, and in 1795 was in command of a small squadron off Smyrna.

Transferred to the *Zealous* in 1797, Hood was under Nelson at Santa Cruz and the Nile, 1798, being afterwards left in command of the squadron blockading the French army in Egypt. In 1801 he transferred to the *Venerable*, and was present at the action of Algeiras and Gibraltar. As commander-in-chief of the Leeward Islands, 1802, he distinguished himself in actions against French cruisers. In 1804 he was knighted, and, returning to Europe, engaged

at Portsmouth, 1787-88, and commander-in-chief in the Mediterranean in 1793, when he blockaded Toulon and reduced Bastia, 1794. Promoted admiral the same year, he returned to England, in 1796 was made a viscount, and was appointed governor of Greenwich

a French squadron off Rochefort, capturing four large frigates. In 1807 he became rear-admiral and served in the Baltic. In 1809 he was made a baronet, in 1811 vice-admiral, and in 1812 commander-in-chief of the East Indies. He died at Madras, Dec. 24, 1814.

Hood, THOMAS (1799-1845). British poet. Born in London, May 23, 1799, of Scottish descent, he entered a city office at 13. Being threatened with consumption, he was sent to live with relatives in Dundee, where he began to contribute to the local press. Returning to London in 1818, he learnt the art of engraving, but gave it up in 1821 for a post on *The London Magazine*, in which capacity he came in contact with De Quincey, Hazlitt, and Lamb. His first publication to attract notice was *Odes and Addresses to Great People*, 1825, issued in conjunction with J. H. Reynolds, whose sister he married.

Thomas Hood, British poet. From the painting by an unknown hand in the National Portrait Gallery

The two series of *Whims and Oddities* appeared in 1826 and 1827. In 1829 Hood became editor of an annual called *The Gem*, in which was published his own *Dream of Eugene Aram*. The *Gem* was followed in 1830 by *The Comic Annual*. In 1834, owing to financial disaster, Hood with his family removed first to Coblenz, and then to Ostend, with a view to living economically, and in due course paying his creditors in full. In 1840 he returned to England and became editor of *The New Monthly Magazine*, and then of Hood's *Magazine*, a venture of his own. But by 1844 his health had completely broken down, and he died May 3, 1845.

As a poet Hood is not usually profound. But *The Song of the*

Viscount Hood, British sailor After Reynolds

Sir Samuel Hood, British sailor After a miniature

Shirt, contributed to Punch Almanack in 1843, was a moving poem that drew public attention to the sweated labour of sempstresses; The Bridge of Sighs has noble simplicity and compassion; the Ode to Autumn may be compared with Keats's. As a humorist Hood's chief characteristic was his Cockney partiality for the sardonic. He is at his best in pieces like Miss Kilmansegg, wherein the serious and comic are blended. An astonishing punster, who remarked after a rough Channel crossing, "A sick transit has destroyed the glory o' Monday," he indulged this facility in such ballads as Ben Battle, and Faithless Nelly Craig. But he could also make the memorable and quotable phrase which has endeared Eugene Aram, The Death-bed, and I Remember, I Remember, to so many readers. An edition of his poems was made by Alfred Ainger, 1897. *Consult* Life and Times; W. Jerrold, 1909; T. H. and Charles Lamb, W. Jerrold, 1930.

Hood, Tom (1835-74). British humorist, the only surviving son of Thomas Hood.

Tom Hood,
British humorist

Born at Wanstead, Essex, Jan. 19, 1835, he was baptized Tom, and educated at Pembroke College, Oxford. Destined originally for the Church, and for a time in the War office, he took to journalism, and in 1865 he became editor of Fun, to which he contributed jokes, verse, and caricatures. Tom Hood's Comic Annual began in 1867. He also wrote novels, of which the best is Captain Masters's Children, 1865. He died Nov. 20, 1874.

Hoof. Horny covering of the tips of the toes in the ungulate mammals. It corresponds to the claw in other families of the vertebrates—the human nail representing the outermost component of the primitive claw. The hoof grows constantly, and if not worn away by walking and climbing tends to become enlarged and distorted.

Hooft, PIETER CORNELISZON (1581-1647). Dutch historian and dramatist. Born at Amsterdam, March 16, 1581, the son of a Dutch merchant prince, he travelled extensively in France, Germany, and Italy, and studied law at Leyden. The castle of Muiden,

of which he was appointed steward in 1609, became the centre of all the writers, artists, and scholars of the golden age of Dutch literature, and there he created the Muiden Circle. He ranks among the first of Dutch prose writers. His letters, full of charm, are a valuable contribution to a knowledge of the period. His plays include the pastoral Granida, 1615, and the tragedy Theseus en Ariadne, 1614, while of his historical writings, De Nederlandsche Historien, 1642, is considered a classic. Hooft died at The Hague, May 21, 1647.

Hooge. Village of Belgium, in the prov. of W. Flanders, which figured prominently in the fighting of the First Great War. On the Ypres-Menin road, 3 m. E. of Ypres, it was Gen. French's headquarters during the 1st battle of Ypres. The Germans captured the village in May, 1915, and it figured in local British attacks during the following months. This fighting was marked by the constant use of gas by the Germans, a form of attack against which the British gas masks of that date were an inadequate protection. In this sector, too, the Germans used flame-throwers for the first time against British troops (July 30, 1915) with considerable success, but early in August the British retook all ground lost at the expense of 2,000 casualties. There was further hard fighting in June, 1916, when the Germans attacked the Canadian line S. of Hooge, which was held at the cost of 7,000 casualties in ten days of fierce fighting. The ruins of Hooge were reoccupied by the British on July 31, 1917, and the region finally cleared in September, 1918. See Ypres, Battles of.

Hooghli. Western arm of the Ganges delta, India. It is the most important channel by which that river flows into the Bay of Bengal. It is tidal as far as Calcutta, and its chief tributary is the Damodar, rising in the hills of Chota Nagpur. See Calcutta.

Hooghli. Dist., subdivision, and town of India. In the Burdwan division, W. Bengal, its area is 1,206 sq. m. Of the total area about half is under cultivation, rice being the

Pieter Hooft,
Dutch author
From a print

chief crop. The district is an important industrial centre, the exports including rice, cotton, cloth, and gunny bags; among the imports are piece goods and salt. Hooghli town has greatly declined in importance since 1875. It forms a municipality with Chinsura. Pop. dist., 1,490,304; town, 49,081, Hindus greatly preponderating.

Hook. Word used generally for a piece of metal bent into a curve, or at an angle, for catching or holding anything. Usually it is qualified to indicate its particular use, e.g. coupling hook, fish hook. In agriculture a hook is a cutting implement employed for various farming purposes, and usually having a short wooden handle, like a reaping hook or sickle and a bagging (or fagging) hook, with a strong, sharply curved blade, used for cutting beans, etc.

The word is used in the sense of driving a ball off a straight course in golf and cricket; for the sharp bend or curve in a stream or land, as in Sandy Hook; and, in the teaching of writing, for elementary curves called pot hooks.

Hook, CAPTAIN JAMES. Pirate chief in Barrie's fairy story and play, Peter Pan (q.v.). With a hook for a hand, he terrifies his own crew as well as the boys of the Never-Never Land, but is himself scared by a crocodile, which pursues and in the end swallows him. Hook's last words are the motto of Eton College, Floreat Etona. The part has been played with zest by such famous actors as Ainley, Du Maurier, and Charles Laughton.

Hook, THEODORE EDWARD (1788-1841). British wit, novelist, and dramatist. Born in London,

Sept. 22, 1788, he was educated at Harrow and at Oxford. Before going to Oxford he had written farces and melodramas, be-

come known as a man about town, and in 1809 had perpetrated the famous Berners Street hoax, as a result of which that thoroughfare was congested for a whole day by all classes of society, from the duke of Gloucester and the lord mayor to tradesmen and sweeps, who thronged to the house of a lady against whom Hook had a grudge, in response to his bogus invitations and orders of various kinds. He received in 1813, through social

influence, the appointment of treasurer of Mauritius. In 1817 investigation revealed a deficiency of 62,000 dollars (£12,500). The home authorities absolved Hook from criminal proceedings, but held him responsible, and what property he had was seized and he was imprisoned, 1823-25.

Hook never attempted to pay off the remainder of the liability, though he earned large sums by his pen. In 1820 he had started *John Bull*, a Tory journal which, conducted with astonishing vigour, overflowing wit, and incredible scurrility, brought him a substantial income. Nine volumes of novels, *Sayings and Doings*, appeared in 1826-29. His other novels include *Maxwell*, 1830, perhaps his best; *Jack Brag*, 1837; *Births, Deaths, and Marriages*, 1839. He died at Fulham, Aug. 24, 1841. Hook was a man whose powers of improvisation were extraordinary. His *Life* was written by R. H. D. Barham, 1849, rev. ed. 1899.

Hook, WALTER FARQUHAR (1798-1875). British divine. Born in London, March 13, 1798, he was the nephew of Theodore Hook. Educated at Winchester and Christ Church, Oxford, he was ordained and was a curate at Whippingham, Isle of Wight. During 1828-37 he held a living at Coventry, and then was made vicar of Leeds. His immense parish was divided and many new churches built, but more remarkable was the hold the church obtained over the people and the expansion of its influence, due in large measure to the vicar's energy and oratorical ability. Some of his sermons and addresses won a national reputation, and he was long regarded as the model of what a parish priest in a large town should be. In 1859 he was made dean of Chichester, where he wrote *Lives of the Archbishops of Canterbury*, 12 vols., 1860-76. He died Oct. 20, 1875. *Consult* *Life and Letters of Dean Hook*, W. R. W. Stephens, 1878.

Hookah (Arab. *huggah*, vase; bottle). Oriental water tobacco-pipe. Its chief essential feature is a vase containing water, sometimes scented, through which the smoke is passed and cooled. The smoke is drawn from the bowl through a tube into the water, and

Hookah as used in Turkey, showing the long tube through which the smoke passes

thence by a long flexible tube into the mouth of the smoker. The *nargileh* of Persia and the Indian *hubble-bubble*, so called from the noise made by the smoke on passing through the water, are similar in principle. Hookahs are made of porcelain, glass, or metal, etc., and are often richly decorated.

Hooke, ROBERT (1635-1703). English scientist. Born at Freshwater, I.O.W., July 18, 1635, he was educated at Westminster and Christ Church, Oxford. He became professor of geometry at Gresham College, 1665, and permanent secretary of the Royal Society, 1677. He invented the anchor escapement in clocks and used spiral springs in watches; improved the microscope and thermometer; and may have anticipated Newton's law of gravitation and Huygens' pendulum. He died March 3, 1703. *See* *Hooke's Law*.

Hooker, JOSEPH (1814-79). American soldier. Born at Hadley, Massachusetts, Nov. 13, 1814, he was educated at the military academy at West Point. He served in the Mexican War (1846-48), and after the outbreak of the Civil War was appointed to the command of a Federal division.

He succeeded Burnside, in the leadership of the army of the Potomac in Jan., 1863, but he was a fighting general (his nickname was *Fighting Joe*) rather than a leader, and lost the battle of Chancellors-

ville. Though he strenuously resisted Lee's second advance, and later did good service at Lookout Mountain, and the siege of Atlanta, he had lost the confidence of his superiors and retired from active service. He died at Garden City, New York, Oct. 31, 1879.

Hooker, SIR JOSEPH DALTON (1817-1911). A British scientist. Born at Halesworth, Suffolk, June 30, 1817, he took a medical degree at Glasgow in 1839. In the same year he accompanied Sir James Ross's Antarctic expedition in the *Erebus*; publishing on his

Sir Joseph Hooker, British scientist

return an account of the flora of the south temperate and sub-Antarctic regions. In 1848 he led a botanical expedition to N. India, and in 1855 was appointed assistant director at Kew Gardens. It was there that in 1862 the first part of *Genera Plantarum* was prepared. Three years later, his father having died, he succeeded him as director of Kew. In 1872-77 he was president of the Royal Society, being knighted in the latter year. In 1885 he retired from Kew, but continued his botanical work. He was awarded the O.M. in 1907. Hooker died Dec. 10, 1911.

Hooker, RICHARD (c. 1553-1600). English theologian. Born at Heavitree, a suburb of Exeter, he was educated at Exeter and at Corpus Christi College, Oxford, and, vacating his fellowship on his marriage, was appointed rector of Drayton Beauchamp, Bucks, and then Master of the Temple. There his advocacy of Anglicanism against the Calvinism of the afternoon reader Walter Travers, a discussion conducted on lines of mutual respect, inspired his *Treatise on the Laws of Ecclesiastical Polity*, 1594, the earliest important work of the kind in English.

Richard Hooker, English theologian
After Hollar

This work, which was continued while Hooker was rector of Boscombe, Wilts, and Bishopsbourne, Kent, was designed to fill eight books, only five of which were printed in the author's lifetime.

Book six, as we have it, is of dubious authority; and books seven and eight are probably revisions of Hooker's MS. Praised by Hallam for the stateliness and grace of its language, and winning for its author the epithet "judicious," the Ecclesiastical Polity was written to supply a philosophical and logical basis for the English Church as established at the Reformation. The treatise is a masterpiece of logical argument and a classic in respect of the beauty of its English prose. The best edition is that of Keble, revised by Dean Church and Canon Paget, 1888, including Izaak Walton's Life of Hooker. Working almost to the last, Hooker died at Bishopsbourne, Nov. 2, 1600.

Hooker, Sir William Jackson (1785-1865). A British botanist. Born at Norwich, July 6, 1785,

from early youth he was an ardent naturalist. At the age of 35 he had already produced four important works, which included British Jungermanniae, 1816; Muscologia Britannica (with T. Taylor), 1818; Musci Exotici, 1818-20. In 1819 he was elected prof. of botany at Glasgow, and organized the new botanic garden at Sandyford. In 1841 Kew was nationalised, and Sir William, who had been knighted five years earlier, was appointed director.

Hooker did a vast amount of literary work, often in collaboration with others, in addition to his British Flora and several important works on ferns, editing The Botanical Magazine and Hooker's Journal of Botany. He died at Kew, Aug. 12, 1865.

Hooke's Law. Statement first made in 1676 by Robert Hooke (q.v.), of value in the study of metals. He studied the theory of elasticity and stated, in effect, that the stretching of a material depends upon the load applied: i.e. strain is proportional to stress.

Hook of Holland (Dutch, *Hoek van Holland*). Point and village of the Netherlands, in the prov. of S. Holland. The village stands at the entrance of the Nieuwe Waterweg, a waterway constructed 1866-90, the shortest route between the North Sea and Rotterdam. There is a landing stage for steamers with a rly. station near by. The passage by steamer from

Harwich (Parkeston Quay), 120 m., to the Hook takes normally about seven hours, and trains to Rotterdam and Amsterdam run in connexion with the boats. The village is insignificant.

Following the German invasion of the Netherlands on May 10, 1940, British destroyers were ordered to the Hook of Holland. Marines were later landed to hold the port while Queen Wilhelmina was taken off in a destroyer. On May 13 the British forces withdrew after carrying out extensive demolition of the docks and harbour installations. Towards the end of the German occupation rocket bomb sites were established in the vicinity of the Hook of Holland.

Hookworm. Parasite of which five species may affect man. Faeces containing ova are deposited on moist earth, and these ova on contact with the human skin find their way via the oesophagus and stomach to the small intestine, causing haemorrhage and subsequent anaemia. No drug is completely efficacious in getting rid of the parasite. See *Ankylostomiasis*.

Hooley, Ernest Terah (1859-1947). British financier. Born at Long Eaton, Derbyshire, Feb. 5, 1859, he became a stockbroker at 22 and came to London in 1896. By successful deals in company promoting he acquired an immense fortune, at the height of his career commanding over £18,000,000 of capital. His success was brief, for in 1898 he became bankrupt. In 1910 he was convicted of fraud, and in 1922 was sentenced to three years' penal servitude for the same offence. His Confessions appeared in 1925, and he died Feb. 11, 1947.

Hooligan. General term for a street rowdy, especially for one who works with a gang. The word

seems to have been first applied locally c. 1890 to a band of young ruffians who terrorised the Southwark district of London. Their leader was named Hooligan or perhaps Hooley, and the band became known as the hooligans or the "Hooley gang." The term soon spread over Europe, such forms as the Russianised "khuligani" and "hooliganzy" having been met.

Hooper, John (c. 1495-1555). English divine and martyr. Born in Somerset and educated at

John Hooper,
English divine

Oxford, he was for some years a Cistercian monk at Gloucester. Becoming a Protestant he had to quit the country in 1539, but he returned in 1549 and became chaplain

to Protector Somerset and a zealous leader of the reformers. In 1550 Edward VI nominated him bishop of Gloucester, but owing to recalcitrancy on the subject of wearing episcopal vestments he was not consecrated until 1551; in the following year he was given the see of Worcester to hold in *commendam* jointly with Gloucester. Under Mary he was deposed and, on a charge of heresy, burnt at Gloucester Feb. 9, 1555.

Hoopoe (Fr. *huppe*, Lat. *upupa*, Gr. *epops*). Genus of birds found in Europe, Asia, and Africa. The common hoopoe (*U. p. p.*) is an occasional visitor to Great Britain, where it was formerly plentiful. The size of a thrush, it has sandy brown plumage with black and white

Hoopoe. Specimen of the crested bird
W. S. Berridge, F.Z.S.

bars, a handsome crest of erectile feathers on the head, and a long, curved, black and slender beak. It nests in hollow trees and occasionally in walls. The bird feeds mainly on worms and insects. Its name is onomatopoeic, i.e. like that of the cuckoo it represents the curious call uttered by the bird.

Hoorn. Town of the Netherlands, in the prov. of N. Holland. It lies 25 m. by rly. N. of Amsterdam and was formerly, before the draining of the Zuider Zee, a fishing port. The town has industries in tobacco and timber, and is an

Hoorn, Netherlands. 17th century Weigh House in the town square

important agricultural centre for the district, with markets for dairy produce. A steam tramway runs to Enkhuizen. Pop. 12,026.

Hoon was the capital of the old county of W. Friesland, and has many beautiful 17th century houses in the characteristic Dutch style. Among the older buildings of note are the Stadhuis, 1613 (restored 1903); the Weigh House, 1609; and the Proostenhuis, 1632, which houses the W. Frisian museum. Hoon gives its name to Cape Horn, which was first rounded by Willem Schouten (1580-1625), a native of the town. It was also the birthplace of A. J. Tasman (*q.v.*), whose name is commemorated in Tasmania.

Hoosiers. Popular term in the U.S.A. for the inhabitants of Indiana. It was placed on the American literary map in 1871, when Edward Eggleston published *The Hoosier Schoolmaster*, which started the vogue for realistic fiction about the Middle West. Other novelists from Indiana included in the *Hoosier School* are Lew Wallace and Booth Tarkington, while the *Hoosier Poet* is J. W. Riley.

Hoover, HERBERT CLARK (b. 1874). American statesman. The son of a blacksmith, he was born at

Herbert C. Hoover, American statesman

West Branch, Iowa, Aug. 10, 1874, and brought up as a Quaker. Graduating from Stanford university as a mining engineer in 1895, he went to Australia and China, before setting up his own worldwide organization as an adviser on mining practice. On the outbreak of the First Great War he was appointed chairman of the American relief committee in London and commissioner for relief in Belgium. When his country entered the war he became food administrator, and in 1918 was chairman of the American association for relieving European distress. He was secretary of commerce under Harding and Coolidge, 1921-28, being concerned with the relief of the Russian famine of 1921 and of the Mississippi floods of 1927.

A Republican, Hoover stood as "Prosperity" candidate for the presidency in 1928, and was elected by an overwhelming majority. But his term of office coincided with the world economic depression, and after 1930 he had to contend

with a Democrat majority in congress. An outstanding event of his presidency was the granting of the so-called Hoover moratorium on reparations and war debts in 1931; but in 1932 he was decisively beaten by F. D. Roosevelt when he stood for re-election, losing in all but six states. Hoover resumed practice as a mining engineer. In May, 1945, he returned to public life, when he discussed with President Truman the feeding of liberated Europe; next year he became chairman of the U.S. famine emergency committee, touring Europe and India.

Hop Aphis (*Phorodon humuli*). Species of plant louse or aphid very destructive to the hop and kept in check only by the regular use of insecticidal sprays. It overwinters in the egg stage on sloe, bullace,* and damson, more rarely on plum.

Hope. According to the teaching of the Bible, an essential Christian virtue. The Apostle Paul ranks hope with faith and love as one of the three eternal factors of the Christian religion, and describes God as "the God of hope." The N.T. conception of hope may be defined as faith directed towards the future.

There can be little doubt that the success of Christianity in an age of pessimism and despair was largely due to the fact that it was a religion of hope. To paganism the golden age lay buried away in the past, and the world was always receding from the ideal. To Christianity the golden age was always in the future, and every year brought the world nearer to the realization of the ideal. The Christian hope was two-fold. It was partly individual and partly universal. For the individual it held out the promise of life and happiness and deliverance from evil in this world and the next. The anchor of hope held firm amid all the storms of life.

But the Christian hope was not merely individualistic; it was universal in its scope and sweep. It promised a new world—a regenerated humanity and the establishment of the kingdom of God upon earth as the Christian Utopia. It is not easy to realize today the overwhelming power of the Apocalyptic Hope in the Early Christian Church. It was that hope, which finds its greatest expression in the Book of Revelation, that kept the Church alive in days of persecution and enabled it to triumph over the most terrible difficulties and sufferings. See *Charity*; *Faith*.

Hope, ANTHONY. Pen-name of Sir Anthony Hope Hawkins (1863-1933), British novelist. Born in

Anthony Hope
E. O. Hoppe

London, Feb. 9, 1863, son of the vicar of St. Bride's, Fleet St., he was educated at Marlborough and Balliol College, Oxford. He was called to the bar at the Middle Temple in

1887, but his main interest was writing fiction. The *Prisoner of Zenda*, 1894, had an immediate success, and similar stories of love and intrigue in imaginary states of Central Europe included a sequel, *Rupert of Hentzau*, 1898; and *Sophy of Kravonia*, 1906. Another success was the witty social satire, *The Dolly Dialogues*, originally published in *The Westminster Gazette*, 1894. There followed *The Indiscretion of the Duchess*, 1894; *Simon Dale*, 1898; *The Intrusions of Peggy*, 1902; *Mrs. Maxon Protests*, 1911; *A Young Man's Year*, 1915; *Little Tiger*, 1925. The author was knighted in 1918, and died July 8, 1933.

Hope, Bos (b. 1904). American comedian. A Londoner by birth, Lester Townes Hope was born May 26, 1904, one of eight brothers, and went to America as a child. He worked in a motor showroom before going on tour in a dancing act; then a vaudeville act in the middle 1930s earned him bookings at New York theatres and his own radio programme. His first film was *The Big Broadcast* of 1938, in which he starred with Dorothy Lamour; *The Road to Singapore* began a series in which he partnered Bing Crosby. During the Second Great War he toured England, N. Africa, and Sicily to entertain troops.

Hope, JOHN (1725-86). Scottish botanist. Born in Edinburgh, May 10, 1725, he was educated at the university and abroad, and settled as a physician in Edinburgh in 1750. In 1761 he was appointed professor of botany and materia medica at his native city, and king's botanist of Scotland. In 1768 his chair was changed to that of botany and medicine, and eight years later he arranged a medical botanical garden near Leith Walk, where he put into practice the system of classification of his friend Linnaeus, to whom he erected a statue in the garden. He died Nov. 10, 1786.

Hope Diamond. Famous blue diamond, weighing $44\frac{1}{2}$ carats, reputed to bring misfortune to its possessor. At one time the property of the actress wife of Lord Francis Hope, it was originally the eye of a Hindu idol, which legend declares to have placed a curse on it. The diamond was brought from Asia and sold to Louis XIV of France. Its owners have included the tragic queen Marie Antoinette; Sultan Abdul Hamid, who was deposed; and it was sold in 1909 to an American, E. McLean, whose son was killed soon afterwards. Mrs. McLean died in 1947, and it was sold in 1949 to a New York jeweller, H. Winston, for over £250,000.

Hopeh or **HQPEH**. Province of N. China, formerly known as Chihli. Having an area of 54,154 sq. m., it contains 130 counties and two administrative bureaux, with Paoting as its capital. Other important cities are Peking, the ancient capital; Tientsin, the leading port and trading centre of N. China; and Chengting. East of Tientsin is Tangku harbour, one of the finest in Asia. Six rlys. run through Hopeh, which borders Manchuria to the N., Chahar and Shansi to the W., Honan to the S., and Shantung and the Gulf of Chihli to the E. The principal products are wheat, maize, cotton, coal, and salt; while the extraction of iron ore and tanning are industries. Pop. 28,644,437.

Hope-Scott, JAMES ROBERT (1812-73). British lawyer. Born July 15, 1812, he graduated at Oxford in 1832, and was called to the bar in 1838. His first notable success was gained before the house of lords in connexion with the petition against the Ecclesiastical Duties and Revenues Bill. Hope had been retained by the deans and chapters, and his pleading attracted such notice that the same year, 1840, he was appointed chancellor of Salisbury.

He was strongly attracted by the Oxford movement, and was intimate with J. H. Newman, whom he followed, 1850, into the R.C. Church, and whose adviser he was in the Achilli trial, 1852. He acquired a large fortune as parliamentary counsel for railways. In 1853 he became owner, through his wife, of Abbotsford, assuming the name of Hope-Scott. He died April 29, 1873.

Hopetoun, EARL OF. Scottish title borne by the family of Hope since 1703, and now merged in that of marquess of Linlithgow. The family of Hope is

4th Earl of Hopetoun,
British soldier

Hope of Craighall. James (d. 1661) made his name and fortune by developing the lead mines at Leadhills, Lanarkshire. He, also an eminent lawyer, made Hopetoun his residence. His grandson Charles (1681-1742) was made earl.

James, the 3rd earl (1741-1817), inherited large estates from his kinsman, the marquess of Annandale, and was made a baron of the U.K. in 1809. The 4th earl was the soldier who, as Sir John Hope, made a reputation in the Peninsular War. He was Baron Niddry when he succeeded his half-brother in the earldom. John, 7th earl, was made marquess of Linlithgow in 1902. See Linlithgow, Marquess of.

Hopi (peaceful people). Body of N. American Indians inhabiting seven pueblos on three tablelands in N.E. Arizona. Less correctly they called Moqui, they speak a Shoshonian dialect, and number perhaps 2,000. Small and muscular, they represent various tribal elements whose culture has been developed under arid conditions. Their weaving and pottery are excellent. Their snake-dance is in origin a rain-making ceremony.

Hopkins, EDWARD JOHN (1818-1901). British organist and composer. Born in London, June 30, 1818, he became a chorister in the Chapel Royal. Adopting the organ as his instrument, he held several appointments as organist before receiving that of the Temple Church in 1843. He held this post for 55 years, raising the musical service to a high degree of perfection. He retired in 1898 and died Feb. 4, 1901. Hopkins composed anthems, chants, and hymn tunes.

Hopkins, SIR FREDERICK GOWLAND (1861-1947). British biochemist, born at Eastbourne, Sussex, June 20, 1861. After a short period as an insurance clerk, he went to the Royal School of Mines, and later became laboratory assistant to Frankland. In 1888 he joined the medical school at Guy's Hospital, and was elected the first holder of the William Gull research studentship. In 1896 he took over the direction of the Clinical Research Association. At

said to be of French origin. Thomas (d. 1646), having become an eminent lawyer, was made a baronet in 1628, and the baronetcy is still held by his descendant.

Cambridge from 1899 he collaborated with S. W. Cole in isolating and identifying the amino-acid tryptophane, and a readership in chemical physiology was created in Hopkins's favour.

In 1906 he published with W. M. Fletcher an account of the production of lactic acid in muscular activity and its subsequent removal by oxidation; this laid the basis of modern knowledge of carbohydrate metabolism. Next he made the first announcement of the importance of vitamins in diet. He had been elected F.R.S. in 1905; in 1910 he became lecturer in physiological chemistry at Cambridge, where his work on proteins and vitamins earned international reputation, especially on the publication of his *Dynamic Side of Biochemistry*, 1913. He was given the newly created chair of biochemistry.

Knighted in 1925, he delivered the inaugural address at the International Physiological Congress in Stockholm in 1927. In 1929 he was awarded the Nobel prize for medicine for his discovery of vitamin D. An original member of the Medical Research Council, Hopkins was president of the Royal Society in 1931 and of the British Association in 1933. He received the O.M. in 1935, and died May 16, 1947.

Hopkins, GERARD MANLEY (1844-89). British poet. Born at Stratford, Essex, June 11, 1844, he was educated at Highgate School and Balliol College, Oxford, where he became a friend of Robert Bridges. Studying under Pater, he was inspired to join the R.C. church in 1866. A disciple of Pusey and lifelong friend of Newman, in 1868 he entered the Jesuit novitiate, and became select preacher at Farm St., London, Oxford, and Liverpool. In 1884 he accepted the chair of Greek at Dublin University. He died June 8, 1889.

None of his strange and vivid poems was published during his lifetime, but Bridges collected them in 1918: They express in subtle and alliterative imagery, often so condensed as to become crabbed, a search for God and an intense love of nature. Every word is a fragment of a perfect pattern.

Sir F. Gowland
Hopkins,
British biochemist

Hopkins's literary interest lies in his super-sensitive vocabulary and tortuous experiments in prosody. He was responsible for the fashion of "sprung rhythm," in which stress is counted and not syllables. Not until the 1930s was his work really appreciated. His correspondence with Bridges and R. W. Dixon was edited by C. C. Abbott, 1935. There are *Lives* by G. F. Lahey, 1930; E. Ruggles, 1947. *Consult also* The Poetry of G.M.H., E. E. Phare, 1934.

Hopkins, HARRY LLOYD (1890-1946). American administrator. Born at Sioux City, Iowa, Aug. 17, 1890, he graduated from Grinnell College in 1912, and during 1915-17 was executive secretary of the Board of Child Welfare. When his friend F. D. Roosevelt became governor of New York, Hopkins directed its emergency relief administration, and on Roosevelt's election as president he was made federal administrator of emergency relief. In 1938 he became secretary of commerce. In 1941, in charge of the lend-lease programme, he attended a meeting of the British war cabinet, the first foreigner to be invited. He was present at the signing of the Atlantic Charter, accompanied Roosevelt to wartime conferences, and upon the latter's death in 1945 became personal adviser to President Truman, though ill-health soon compelled him to resign. He was presented with the U.S. Distinguished Service Medal, Sept., 1945. He died Jan. 29, 1946. His *White House Papers*, ed. R. E. Sherwood, 2 vols., were published in 1948-49.

Hopkins, JOHN (d. 1570). English clergyman. Educated at Oxford, he became a schoolmaster, and from 1561 was rector of Great Waldringfield, Suffolk. With his friend Thomas Sternhold (*q.v.*) he was part-translator of the metrical version of the Psalms printed by J. Day in 1562, once attached to the Book of Common Prayer, and superseded in 1696 by the version of Tate and Brady. Hopkins' initials are attached to 56 of the 150 psalms.

Hopkins, MATTHEW (d. 1647). The English witch-finder. During 1644-47 he made journeys through Essex, Suffolk, Norfolk, and Huntingdonshire in pursuit of quarry. As witch-finder-general he seems to have been responsible for the deaths of several hundred old women and also of John Lowes, the octogenarian vicar of Brandeston. Denounced as a wizard, he was submitted to his own test of being thrown into a pool with

thumbs and toes bound together crosswise, and, swimming instead of sinking, was pronounced guilty and hanged. *See* Witchcraft.

Hopkinson, JOHN (1849-98). British engineer. Born at Manchester, July 27, 1849, and educated at Owens College and Trinity College, Cambridge, he graduated senior wrangler in 1871. He became engineering manager in some glass works in Birmingham and there he in-

John Hopkinson,
British engineer
Elliott & Fry

vented improvements for lighthouse mirrors. Moving to London in 1878, he set up for himself as consulting engineer. He improved dynamos and introduced the series-parallel system for motors. He was professor of electrical engineering at King's College in 1890. While mountaineering in Switzerland he and three of his children were killed, Aug. 27, 1898.

Hopper. The name given to a number of insects, in particular the hop flea, one of the most destructive of plant-eating beetles, especially the hop plant; the larva of the cheese fly; and in the compound grasshopper.

In engineering a hopper is any enclosed chamber or vessel with sides which slope downwards towards an outlet closed when required by a trap door or panel. Hoppers are provided in the bottoms of bunkers for the discharge of their contents by gravity. The sloping sides of a hopper are set at such an angle that the contained material will slide freely down towards the opening. Hopper barges, used in dredging, have hinged flaps on their bottoms, enabling the dredgings to be quickly and easily discharged. Hopper dredgers combine the ordinary dredger and

hopper barge and work on a similar principle to the hopper.

A hopper in brewing is the vat used for infusing hops. The word is also a popular name for hop pickers.

In certain types of pianoforte actions the escapement lever is called a hopper because it hops out of a notch when struck.

Hoppner, JOHN (1758-1810). British painter. Born at Whitechapel, of German parents, April 4, 1758, he became a boy chorister in the royal chapel. His mother, a German attendant at the palace, was in favour with George III, who made the boy a small allowance to enable him to study at the R.A. schools, 1775. In 1782 he gained the gold medal for an historical painting; he was elected A.R.A. in 1792, and R.A. in 1795, having been appointed portrait painter to the prince of Wales in 1789. After Reynolds's death he had no rival in portrait painting except Lawrence, and enjoyed a virtual monopoly of the Carlton House circle. He died Jan. 23, 1810.

John Hoppner,
portrait painter
Self-portrait

The prince of Wales, the dukes of York and Clarence, Wellington, St. Vincent, Pitt, Castlereagh, Canning, the countess of Darnley, the countess of Oxford, and Lady Mary Arundel were among his sitters. His style was based on that of Reynolds, but his colouring is individual and brilliant, and his landscape backgrounds are specially effective; his drawing was often indecisive. He was highly successful as a painter of children. *See* illus. Abercromby; Bedford, Duke of; Duncan, Viscount; Erskine, Baron; Gifford, W., etc.

Hops and Hop-growing. The hop (*Humulus lupulus*) is a perennial twining plant of the family Cannabinaceae, native of temperate Europe, Asia, and North America, growing wild in English hedgerows as far N. as Yorkshire; in Scotland and Ireland as an escape from cultivation. It has a stout, branching, underground rootstock, from which arise the annual stems, rough with small hooks, which twine themselves "with the sun" around any available support, to a height of 15 ft. to 20 ft. The large, rough, heart-shaped, lobed and toothed leaves are produced in opposite pairs.

Hops. Leaves, and cone-like heads of hops ready for picking

Each plant is either male or female, the respective flowers being quite unlike. The small green male flowers, which consist of sepals and stamens only, are clustered in branching sprays, while the females form spikes in which the flowers are hidden by overlapping bracts. After pollination by the wind these develop into cone-like heads—the hops of commerce. At the base of each scale of the cone there are glands which exude a resinous substance known as lupulin, to which the entire importance of the hop is due.

The cultivation of the hop for brewing dates back in Europe to the Middle Ages, but the industry was not known in England until 1524, when it was introduced from Flanders. But the use of hops by brewers encountered strong popular opposition. Nowadays about 20,000 acres are devoted to their cultivation in Kent (chiefly), Sussex, Surrey, Hants, Hereford, and Worcestershire, while additional supplies are imported from the continent of Europe and British Columbia.

The cultivation is attended by considerable expense owing to the need for vigilance in countering the attacks of insect and fungoid pests. Propagation is effected by division of the "sets" or root-stocks, and strings supported by poles are provided for the stems or "bines" to twine around. A modern development of this, known as the telegraph system, consists of horizontal wires, crossing the garden and supported by poles, from which strings depend for training the bines.

The most favourable soil for hop-growing is a calcareous loam, heavily manured with nitrogenous material in autumn, followed by frequent dressings of phosphates. The cones, when ripe, are hand-picked from the bines and dried in kilns or oast-houses by air at a temperature between 120° F. and 140° F., and are then fumed with the gas of sulphur dioxide to fix the colour and odour. The latter emanates from the golden powder into which the lupulin has consolidated. The yield of dried hops per acre varies greatly from year to year, according to weather conditions and the comparative prevalence of pests, but the average may be put at 10 cwts.

In medicine hop products are regarded as tonic, stomachic, and moderately narcotic. The freshly dried cones made into a pillow are useful for procuring sleep by inhalation of the aroma. They are

Hops and Hop-growing. London hop-pickers at work among the prolific crops at Paddock Wood, Kent, during the Second Great War

used, also, for fomentations and poultices; and extract and tincture of lupulin are prescribed. The pure lupulin grains may be shaken from the scales of the hops, but much of the commercial lupulin is obtained by sifting the sweepings of the oast-houses.

To pick the hops labour of a most unskilled type is brought from London and other large towns, special arrangements for this purpose being made by the railway companies. Men, women, and children work in the fields in groups at a scale of pay agreed upon between employers and employed. The conditions under which these people live when at work are primitive, their shelter being often barns and outhouses, but many families in the East End look forward to their week in Sept. in the Kentish hop grounds. Some improvement has been brought about by mission work. See Beer; Brewing.

Hop-Scotch. Game played by children. It is very old and quite simple. With a piece of chalk, a space is marked upon the ground, and this is divided into a number of divisions, 10 or 12, which are numbered. While hopping, the player must kick a stone into each one of the squares in order, coming back to where he started from. If he kicks the stone too far, or into the wrong division, he gives way to another player, and so on. Scotch is an old synonym for scores, hence the name.

Hopton, RALPH HOPTON, BARON (1598–1652). English royalist. A Somerset man by birth, he was educated at Lincoln College, Oxford. Like many other young men of that time, he obtained some military experience abroad, fighting for the elector palatine during the earlier part of the Thirty Years'

War. He was returned to Parliament in 1640, and was knighted. When the Civil War broke out Hopton was made lieutenant-general for the king in the west. He was mainly responsible for the royalist successes in Cornwall, where in 1643 he gained a victory at Stratton. At Lansdown Hill he was again successful, but afterwards fortune was less kind to him and he was beaten at Cheriton in 1644.

Baron Hopton, English royalist After Van Dyck

However, he continued in the field and in Jan., 1646, became commander-in-chief; but, defeated at Torrington, he soon surrendered. He was with the prince of Wales, afterwards Charles II, in the Channel Islands, but his concluding years were passed in retirement at Bruges, where he died in Sept., 1652. His barony, granted by Charles I, became extinct on his death.

Hoguian. City of Washington, U.S.A. On Gray's Harbour, in the "co. of that name, on the Pacific coast, it controls with Aberdeen the commerce of the U.S. greatest lumber port and also exports fish. Wooden products are made. Pop. 10,835.

Hor. Mt. in Arabia on which Aaron died. It has been identified with Jebel Harun, on the summit of which the alleged tomb is shown.

Horace (65–8 B.C.). The Roman poet whose full Latin name was Quintus Horatius Flaccus. He was born Dec. 8, 65 B.C., at Venusia in Southern Italy, and died at Rome, Nov. 27, 8 B.C. His father, though only a freedman, was determined

that his son should have the best education obtainable. After six years' schooling in Rome Horace was sent to Athens at the age of eighteen to complete his studies. On the outbreak of the civil war he received an appointment as an officer in the Republican army, and was present at its defeat at Philippi in 42. Returning to Italy, Horace's comparative obscurity saved him from the proscription which was the fate of more important personages in the vanquished party, and before long he was occupying a junior post in the public service.

About the year 38 came the turning point of his life, when he was introduced by Virgil to Maecenas, the generous patron of letters, who was then collecting around him the literary aspirants of the time. Horace's aspirations were to achieve distinction in satire, expressed in hexameter verse, that peculiarly Roman form of literature invented by Lucilius. Five years after the publication of his first book of satires he published his epodes, a small collection of lampoons, but this was a disappointing effort after the promise shown in its predecessor. After the epodes came another book of satires in which Horace strikes a surer note. The vulgarity and scurrility which had characterised some of his earlier productions tend to disappear, being replaced by a quiet humour and a sane criticism of life based on a shrewd knowledge of human nature.

The Four Books of Odes

The crowning achievement of Horace's life is to be found in his immortal odes, *monumentum aere perennius* (a monument more enduring than bronze), to use the poet's own words. Three of the four books of odes were published in 23 B.C., while the fourth appeared at a later date. The first three books represent about ten years' work, and cover a wide variety of themes—love and conviviality; the joys of country life on the Sabine farm which the generous Maecenas had given Horace; the glories of Rome's past and the still greater glories of its present as personified in the emperor Augustus, whose genius had brought order and good government out of the chaos of the civil wars. In form the odes are based on Greek models, and Horace shows amazing skill in adapting the Latin language to an extraordinary variety of metres, notably Alcaic and Sapphic. The odes abound in familiar quotations, which is no small measure of the universality of their appeal.

The maturity of Horace's genius

Horace, the Roman poet as depicted in a fresco by Raphael

Vatican, Rome

is also reflected in his epistles, which, like the satires, are cast in hexameter verse. It is in these expressions of his outlook on life and literature more than in any other of his works that Horace reveals himself most intimately. One of the epistles is the work commonly known as the *Ars Poetica*. The principles of literary criticism which it expounded were not meant by Horace to be taken too seriously, but later ages curiously enough regarded the *Ars Poetica* as an authoritative guide.

The Poet's Artistry

Certain obvious criticisms present themselves. Horace did not sound the depths of passion as other great lyric poets have done, and his reflections on the mysteries of life and death often verge on the commonplace. Yet his will always remain among the great names of literature. As a literary artist he is unsurpassed. Literally hundreds of the phrases in which he has crystallised his thoughts have passed into the currency of the educated of all time. The ability to make an apposite quotation from Horace was once considered an essential of the education of a gentleman. The following are the approximate dates of his works: Satires i, 35 B.C.; Satires ii and Epodes, c. 30 B.C.; Odes i, ii, iii, 23 B.C.; Epistles i, 20 B.C.; *Carmen Saeculare*, 17 B.C.; Odes iv, 13 B.C.; Epistles ii, *Ars Poetica*, between 13–8 B.C. JOHN McBAIN

Bibliography. The most useful edition for the general student is that by E. C. Wickham with English notes, 1903. There are renderings into English verse by J. Conington, 1863; Sir T. Martin, 1881; Lord Dunsany translated the Odes, 1947. *Consult also* Roman Literature, W. S. Teuffel, trans. G. C. Warr, 1891–92; H. and the Elegiac Poets, W. Y. Sellar, 1892; H. and his Lyric Poetry, L. F. Wilkinson, 1945; Portrait of H., A. Noyes, 1947.

Horae (Gr. *Horai*). In Greek mythology, the goddesses of the seasons, daughters of Zeus and Themis. They regulated the seasons so as to promote the fertility of the earth. Their number varied from two to four; their best known names were Thallo, Carpo, and Auxo, goddesses of the bloom, ripening, and increase of fruit. In Hesiod their names are Eunomia, good order, Dikē, justice, and Eirēnē, peace, indicating that the earlier weather goddesses had attained a moral significance as the preservers of law and order in human life as well as in the realm of nature. In art they are represented as beautiful young maidens, bearing the fruits of earth incident to the season with which each was identified. Temples were erected in their honour at Athens, Corinth, Argos, and elsewhere.

Horae Subsecivae (Leisure Hours). Volumes of essays and papers by Dr. John Brown (*q.v.*), published in 1858, 1861, and 1882. The first volume deals mainly with subjects more or less intimately connected with the author's medical profession. In the second series was included the famous Rab and His Friends, and in the third papers on Leech and Thackeray. The essays, which include many notable studies of Scottish characters, are written in a simple and engaging style. *Consult* Dr. John Brown, J. T. Brown, 1903.

Hora Kutná or KUTNÁ HORA. Town in the Bohemian portion of Czecho-Slovakia. It is 47 m. E. of Prague on the main rly. to Vienna. A mining town, it was famous in the Middle Ages for its silver-lead mines, but was ravaged in the Thirty Years' War. It preserves some notable buildings, including a former royal residence. Iron founding, the manufacture of farm implements, and calico, tanning, and sugar refining are modern industries. Pop. 14,370, mostly Roman Catholics.

Horatii. In Roman legend, three brothers born at one birth, who, in the war against Alba in the reign of Tullus Hostilius, were chosen to fight the three brothers of the Alban army, named Curiatii, also born at one birth. After two of the Horatii had been killed, and the three Curiatii wounded, the third of the Horatian brothers pretended to flee. Followed by the Curiatii, he slew them singly, one after the other. As the victor returned to the city in triumph, he was met by his sister, who was betrothed to one of the dead Curiatii.

Recognizing her lover's cloak among the spoils, she cursed her brother, who in his anger turned

and slew her. Brought to trial, Horatius was condemned, but on appeal to the people received pardon, on account of his valour. Horatius Cocles, who defended the bridge across the Tiber against Lars Porsena, was a descendant of Horatius. See Cocles.

Horbury. Urban dist. of the W. Riding of Yorkshire, England. It is 4 m. by railway S.W. of Wakefield. There are manufactures of woollens, worsteds, yarns, sports equipment, rly. wagons, mining tools, and machinery. Pop. 7,791.

Hordaland. Fylke or county of Norway, formerly called S. Bergenhus. Bounded W. by the Atlantic and E. by Buskerud and Telemark counties, its coast is indented by the Hardanger and other fjords, and it has an area of 6,043 sq. m. Fishing is an important industry. The chief town is Bergen. Pop. 186,953.

Horder, THOMAS JEEVES HORDER, 1st BARON (b. 1871) British physician. Born at Shaftesbury, Jan. 7, 1871, he was educated at London university and St. Bartholomew's Hospital, of which he became senior physician. Knighted in 1918, he was physician in

Lord Horder,
British physician

ordinary to the prince of Wales from 1923, retaining the post through his reign as Edward VIII and also under George VI. Horder was raised to the peerage in 1933. His interests covered dietetics, radiology, eugenics, and physical training, and he was president of the food education society and adviser to the ministry of Food. He wrote *Health and a Day*, 1937.

Horeb. Another name for Mt. Sinai, Egypt. It is identified with Jebel Musa, on which the law in the O.T. is supposed to have been given. The monastery of S. Catherine is near by. Horeb and Musa are the twin peaks of Mt. Catherine, one of the traditional heights claimed as Mt. Sinai.

Hore-Belisha, LESLIE (b. 1893). British politician. He was educated at Clifton and S. John's College, Oxford. Following some experience as a journalist, he entered parliament as Liberal M.P. for Devonport in 1923, and was called to the bar that year. As minister of Transport, 1934-37, he introduced the Belisha Beacon

(g.v.) and the pedestrian crossing over highways, also the test for motor-drivers, the speed limit for the built-up areas, and other road reforms. During his term as secretary for war, 1937-40, conditions of service were improved and better opportunities of promotion

L. Hore-Belisha,
British politician

offered, though his "axe-ing" of senior officers aroused some resentment. In April, 1939, he was responsible for putting into operation the first peace-time conscription measure in Great Britain and for instituting the short-lived "militia." He resigned in Jan., 1940, and was out of office—among other activities, contributing articles to *News of the World*—except for a short period as minister of National Insurance, in 1945, in which year he lost his seat and joined the Conservative party. Hore-Belisha was an elder of the congregation of Spanish and Portuguese Jews.

Horehound (*Marrubium vulgare*). Perennial herb of the family Labiatae. It is a native of Europe,

Horehound. Foliage and flower whorls of this medicinal herb

N. Africa, and Asia, and has heart-shaped, leathery, wrinkled leaves with rounded teeth, and white flowers in dense whorls. The whole plant is woolly and aromatic. The Romans esteemed it as a drug, but it is now used only in domestic medicine as a remedy for coughs.

Horice or **Horitz.** Town of Czecho-Slovakia, in Bohemia. It lies 14 m. N.W. of Königrätz (Hradec Kralove), on the Bistritz. A manufacturing town with textile factories and sandstone quarries.

There is another Horice in the Krumau district of Bohemia,

called the Oberammergau of the Böhmerwald, where representations of the Passion Play have been given at intervals since 1816.

Horizon (Gr. bounding). Imaginary circular line round which the earth and sky appear to meet and bounding that part of the terrestrial surface visible from any given point. It is most clearly defined at sea. If r is the radius of the earth, the distance d of the horizon from an observer at a height h above sea level can be found from Pythagoras:

$$d^2 = (r+h)^2 - r^2 = 2rh + h^2.$$

Since h is small compared with r ,

Horizon. O, observer; C, centre of earth; H, horizon. See text

h^2 may be neglected, so that to a first approximation $d = \sqrt{2rh}$. If h is given in feet and the mean radius of the earth is taken as 2956.5 miles, the formula becomes

$$d = \sqrt{(7913h/5280)}$$

$$= 1.224\sqrt{h} \text{ statute miles}$$

$$= 1.066\sqrt{h} \text{ nautical miles.}$$

This gives the approximate distance of the true horizon. But refraction tends to make the surface of the sea visible slightly beyond this point, and an arbitrary correction of 8 p.c. is usually applied, giving

$$d = 1.322\sqrt{h} \text{ statute miles}$$

$$= 1.148\sqrt{h} \text{ nautical miles.}$$

For many purposes of practical navigation the formula $d = 1.1\sqrt{h}$ is found to be sufficiently accurate.

In observations of the altitude of celestial bodies allowance must be made for the dip of the horizon, i.e. the vertical angle between true horizontal and the line OH from the observer to the visible horizon. The angle is equal to the angle subtended by OH at the centre of the earth, and its value in minutes of arc approximately equal to d , where d is in nautical miles. Again a correction for refraction (usually -7.5 p.c.) has to be applied, so that the dip in minutes of arc works out at $0.983\sqrt{h}$, where h is in feet.

The astronomical horizon may be defined as a great circle in which a plane tangential to the surface of still water at the place of observation cuts the celestial sphere. The term geological horizon refers to the chronological position of any rocks which have been formed at the same period of the earth's evolution, irrespective of their method of origin or stratigraphical arrangement.

The artificial horizon used in astronomy consists of a flat dish containing mercury so placed that it forms a horizontal reflecting surface. It is employed for determining the altitude of the sun by measuring the angle between the direction of the sun and its image reflected in the mercury. The artificial horizon used in air navigation is an instrument operated by a gyroscope designed to keep an indicator permanently parallel with the true horizon. It shows the pilot the angle of his aircraft in cloud or bad weather.

Horley. Parish and village of Surrey, England. It stands on the Mole, 5 m. S. of Reigate, is known to motorists as the half-way mark from London to Brighton, and has a railway station. The church is an old building dedicated to S. Bartholomew. Pop. 7,749.

Hormone (Gr. *hormasin*, to excite). A chemical messenger. Hormones are complex chemical substances secreted by various glands of the body and passed direct into the blood stream without the medium of a duct. Carried to distant parts of the body, they produce a stimulating or modifying effect on growth or function. These chemical reactions represent a stage in evolution when controls were chemical, not nervous. See Endocrinology.

Hormuz or **ORMUZ**. Ancient city of Persia, built partly on an island and partly on the mainland, in the narrow channel, the Strait of Hormuz, connecting the Persian Gulf with the Gulf of Oman. It was founded in the 3rd century, and soon became a great centre of commerce. It was captured by the Portuguese in 1594, and from them by the British in 1622. It steadily declined in importance, and Bandar Abbas, which lies on the mainland a few miles N. of Ormuz Island, has taken its place. The island has deposits of red ochre, some being normally exported to Great Britain. The name Hormuz is now held by an inland village, some 70 m. W. of Bandar Abbas at the foot of the Kuh-i-Hormuz, 9,200 ft.

Horn (Lat. *cornu*). Name given to the substance which forms the claws, nails, etc., of animals, and also to particular growths, e.g. loosely, the antlers of deer, or more properly the horns of a cow. True horn is a modification of epidermic tissue, and is seen in the nails and hair of human beings, the hair, claws, and hoofs of animals, and beaks and feathers of birds. The scales of snakes are of a horny nature; tortoiseshell and the corns and callosities of animals are different varieties.

In the horns of cattle, sheep, and antelopes the central part is bone, the outer core being the true horn tissue. These horny sheaths are shed annually, in the prong-horn antelope, the bony centre continuing to grow to maturity, but in oxen and sheep the horny sheath remains throughout life. Such

horns are developed after birth, except in the giraffe, the only animal born with horns. The shape and size and position of the horns are distinctive in each animal, as also is the cross section.

The composition of true horn is substantially that of keratin (*q.v.*) and consists of about 50 p.c. carbon, 6-7 p.c. hydrogen, 20-25 p.c. oxygen, 16-17 p.c. nitrogen, the remainder being sulphur. It is laid down in the substance of the most superficial layers of the human skin and is rubbed off as the cells containing it die. The cells lining the vagina of mice and other mammals become horny at mating time.

Horn is still in use for making buttons, handles of knives, forks, umbrellas, etc., and ornaments, though partly superseded by plastics. The horns of ox, sheep, and goat are the more commonly used, and when softened by long-continued soaking can be split into layers. These layers are flattened under pressure and coalesced once more by pressure and alternate soaking in hot and cold water. The horn can readily be dyed, and the dyed horns of the cheaper kind are used for imitation tortoiseshell. See Black Buck; Cattle.

Horn or **FRENCH HORN** (Fr. *cor*; Ital. *cornu*; Ger. *Horn*). Brass instrument of tenor compass, derived from the primitive hunting-horn. When horns began to be made of metal, there was no longer any limit of length, and it was found that a long tube would

Horn. Three-valved French horn as used in orchestras

furnish more notes than a short one, by varying the lip—not the wind—pressure. The tubes were coiled for convenience of handling, and quite elaborate fanfares were played on the hunting horns during the period 1650-1750.

The horn appeared in the orchestra soon after 1700. It possessed then only the harmonic series of notes, which on the horn pitched in F sounded:

No. 1 is not commonly used, and Nos. 7, 11, 13, and 14 are out of tune with the ordinary scale. Horns in several keys were employed in order to make the best use of their incomplete scales, and Bach wrote some extremely florid horn parts, with only these notes at his disposal, and had to seek a consecutive scale amongst the higher notes (8 to 16), just as he and Handel did with their trumpets. But the best tone with the horns lies between Nos. 4 and 12, and it was a gain to music, when a Dresden player named Hampl, about 1770, discovered that the insertion of the right hand in the bell of the instrument lowered the pitch. A diatonic scale from Nos. 4 to 8, and a complete chromatic scale from 5 to 16, became possible. It is true that the stopped notes were less resonant than the others, but the device inspired Haydn, Mozart, Beethoven, Schubert, Weber, Mendelssohn, and Spohr, for about a century from 1750, to allot to the horns some immortal strains.

To minimise the use of stopped notes, horns in various keys were still used, and the classic form of the instrument during this period was a single horn, built in B flat alto (sounding a tone lower than the written notes), with crooks—extra coils of tubing—to lower the pitch to any key down to A flat basso, a major tenth lower than the notation (*see* Interval). Their music was always written in key C, or in a related key, with altered notes as accidentals, and the actual

sounds depended on the crook named at the beginning of the score. The typical transpositions shown here make this clear.

The final revolution in horn playing came with the addition of pistons (*q.v.*) on the system adopted for military brass instruments. These have given the horn a complete chromatic scale of even power. There is now no reason for writing for the horn as a transposing instrument except tradition. The player thinks of the actual pitch of the note he is to blow before he can secure it, as a singer does; and the horn player's written notes have all to be translated in his mind into terms of true pitch. The compass of the horn being large, it is usual to divide players into firsts and seconds, who cultivate the lip pressures for high and for low ranges respectively. Convenient limits are:

When more than two horns are used in the orchestra they are still treated in pairs, 3 and 4 being relatively another 1 and 2. See Clarinet; Cornet; Trumpet; consult also The French Horn, J. Blaikley, 1909.

Horn, CAPE. The southernmost point of S. America. It is the terminal point of Horn Island, in the archipelago of Tierra del Fuego, and belongs to Chile. A

steep, bare, black rock, 1,390 ft. high, with pointed peaks, it was discovered by the Dutch navigator Schouten in 1616, who named it Cape Horn after his birthplace. Drake sighted it in 1578. Drake's ship separates it from the South Shetland Islands, Antarctica. Sailing vessels round the cape, but steamers use the Strait of Magellan. Windjammers frequently had to make two or more attempts to pass from the Atlantic to the Pacific against the prevalent W. winds. Consult Cape Horn, F. Riesenbergh, 1941.

Horn, ALFRED ALOYSUS (d. 1931). Scottish trader and traveller. Born near Glasgow, and educated in Liverpool, he went to W. Africa in 1871 and became a trader in ivory and rubber. Then he tried a roving life, shot big game, and fought in several wars. In Johannesburg he met Etheldreda Lewis, the novelist, and was persuaded by her to recount his adventures and crystallise his quaint philosophy in such books as *Harold the Webbed* and *The Ivory Coast in the Earlies*. The latter formed the basis of a film, *Trader Horn*. He visited England in 1927 and died June 26, 1931.

Horn, ARVID BERNHARD, COUNT (1664-1742). Swedish statesman. He was born at Vuorentaka, Finland, April 6, 1664, and, having served with distinction with the Swedish army against France, 1690-95, was promoted to the rank of general in 1700. Four years later, having taken part in the deposition of Augustus of Poland and the election of Stanislas, he became ambassador to the latter.

In 1710 he became Swedish chancellor. In 1719, after the death of Charles XII, he made the granting of a new constitution the condition of the election of the late king's sister Ulrica to the throne, persuading her to accept it by election instead of hereditary right. As leader of the Cap party, he was in effect the ruler of the country, which flourished so under him that "the time of Arvid Horn" became proverbial. In 1738 the rival Hat party succeeded in gaining power, and Horn retired, having put together a code of laws and secured its approval by the diet in 1734. He died April 17, 1742.

Hornbeam (*Carpinus betulus*). Native British tree of the family Betulaceae. Its average height is 60 ft. It is an excellent hedge plant, and may be raised from

Hornbeam. Specimen of a sapling of this British tree

seeds planted in the autumn and transplanted when the seedlings are three years old. A good tree for a heavy soil, it forms a strong fence against horses and cattle. The timber is very hard, but of no great value for commercial purposes except those of the wheelwright. It is, however, much esteemed for use by charcoal burners. The hornbeam may be distinguished from the beech by (among other points) its deeply serrated leaves. It is very common in Epping Forest. See Deciduous Tree.

Hornbill. Popular name for the birds of the family Bucerotidae, which have horn-like growths at the base of their great beaks. They vary in size from about that of a rook to the dimensions of a turkey, and are found in the warmer regions of the Old World, especially in India and Africa. They spend most of their time on the ground, being slow fliers, and feed chiefly on fruit and insects. The nest is constructed in a hollow

Hornbill. Bare-beaked variety, *Ceratogymna elata*, a native of West Africa

tree and during incubation the male plasters up the hole, leaving only a small opening through which he feeds the sitting hen.

Hornblende. Important rock-forming mineral. Hornblende is a complex silicate of calcium, magnesium, and iron, with sodium and aluminium, of variable composition. All varieties crystallise in the monoclinic system with a characteristic prismatic cleavage. Edenite is light coloured, poor in iron; pargasite is dark green or blue; basaltic hornblende is a brown or black variety. Hornblende occurs as a primary mineral, in acid and intermediate igneous rocks; more rarely in basic rocks; commonly in metamorphic rocks derived from igneous rocks, such as gneisses, schists and amphibolites.

A hornblende schist is a foliated metamorphic rock of hornblende with lesser amounts of feldspar, quartz, iron oxides, epidote, and sometimes garnet. With increase in coarseness of texture, it grades into amphibolite. It is commonly derived from basic igneous rock or volcanic ashes by alteration due to earth movements accompanied by heat. Hornblende is an intrusive igneous rock of hornblende, occurring in dykes; it has a coarsely crystalline or granitic texture.

Hornbook. Early form of school primer used in England down to the time of George II. It consisted usually of a flat piece of wood provided with a handle, on which was placed or tacked a sheet of

paper or parchment containing the alphabet, numerals, combinations of the vowels with b, c, and d, and the text of the Lord's Prayer, protected by a layer of transparent horn. Sometimes the paper was pasted on to the wood, sometimes let into a hollowed-out space. The first hornbook was made about 1450. The hornbook is referred to in Shakespeare's *Love's Labour's Lost*, 5, 1.

Horncastle. Urban dist. and market town of Lincolnshire, England. It stands at the foot of the

Horncastle, Lincolnshire. Parish church of S. Mary, which contains interesting monuments

Philip G. Hunt & Co

Wolds at the junction of the Bain and Waring streams, 21 m. by railway E. of Lincoln. The town is chiefly noted for a great horse fair held annually in Aug., and described by George Borrow in *Romany Rye*. In the church of S. Mary is a monument to Sir Ingram Hopton, who was killed in an attempt to seize Cromwell at the skirmish near Winceby in 1643. A Roman ditch and Roman wall are the sole reminders of the Roman station, Banovallum. Horncastle gives its name to a co. div. returning one member to parliament. Market day, Sat. Pop. 3,500.

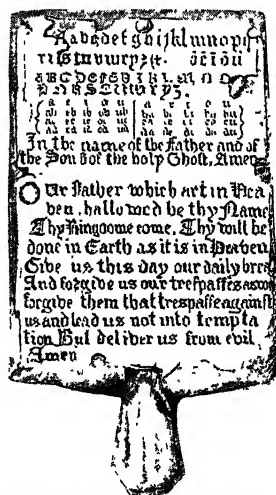

Hornchurch. Town and urban dist. of Essex, England. It is 14 m. E. of London, near Romford, and is mainly agricultural and residential. S. Andrew's church has a carved ox-skull with wide-spread horns on the apex of the E. gable, assumed to symbolise the name Hornchurch. The large airfield was used as an R.A.F. fighter station in the battle of Britain, 1940. During the Second Great War it was on the outer ring of London's A.A. defences, and, in spite of the scattered nature of its buildings, half were made unserviceable by enemy air action. Hornchurch is served by rly. and by the District line. One M.P. is elected. Pop. 28,417.

Horne, ROBERT STEVENSON HORNE, 1st VISCOUNT (1871-1940). British politician. Born Feb. 28, 1871, he was educated at George Watson's College, Edinburgh, and Glasgow university, and between 1895 and 1900 was professor of philosophy at University College, Bangor, and Aberdeen university. Called to the Scottish bar in 1896, he took silk in 1910. At the beginning of the First Great War he was secretary of the agricultural section of the National Service Department, later going to France on the directorate of transport, and in 1918 becoming 3rd civil lord of the Admiralty and K.B.E.

Elected in 1919 Conservative M.P. for Hillhead, Glasgow, he was made minister of Labour. In 1920 he became president of the board of trade, and in 1921 chancellor of the exchequer. With the fall of the Coalition government he abandoned politics for the City, becoming chairman of the G.W.R. and a director of P. & O. and Lloyds Bank. During 1921-24 he was lord rector of Aberdeen university. A viscount from 1937, he died Sept. 3, 1940.

Horne, CHARLES SILVESTER (1865-1914). A British Congregational preacher. Born at Cuckfield, Sussex, April 15, 1865, he was educated at Newport (Salop), Glasgow university, and Mansfield College, Oxford. Minister of Kensington chapel, 1889-1903, he was chairman of the London Congregational Union, 1902, and minister of Whitefield's Tabernacle, 1903-14. Keenly interested in social and political questions, he was Liberal M.P. for Ipswich from 1910 until his death, May 2, 1914. He wrote *Story of the London Missionary Society*, 1894; *Popular History of the Free Churches*, 1903.

Horned Screamer (*Anhima cornuta*). Large goose-like bird found in S. America. The plumage

Hornbook found at Middleton in 1828. The black-letter alphabet and prayer is protected by transparent horn pinned to the wood

C. Silvester Horne, British preacher
Elliott & Fry

Horned Screamer. Specimen of this South American bird

is glossy black above, with white below, and the bird has a long, yellow, hornlike growth on the head. *See Screamer.*

Horned Toad (*Ceratophrys*). Large batrachian found in S. America, often 6 ins. long. It has an enormously large mouth, and feeds chiefly on frogs. Ten species are known.

Horned Viper (*Cerastes cornutus*). Snake found in N.E. Africa up to Palestine. It frequents sandy

Horned Viper. Specimen of this venomous N.E. African snake

places, where it lurks half buried, leaving only the eyes, horns, and nostrils to be seen. It is highly venomous, and specimens range up to 30 inches in length.

Hornel, EDWARD ATKINSON (1864–1933). British artist. Born at Bacchus Marsh, Australia, of Scottish parents, he was brought home to Kirkcudbright. He studied for three years at the R.S.A. schools, Edinburgh, and for two under Verlat at Antwerp, returning to Scotland in 1885, when he identified himself with the Glasgow school. He visited Japan and then settled down at Kirkcudbright. In 1901 he was elected to the Royal Scottish Academy, but declined the honour.

Among his works one may cite especially *Fair Maids of Feb-*

E. A. Hornel, British artist
T. & P. Annan

ruary, 1900; *Water Lilies*, 1901; *Autumn*, 1905; and *The Music of the Woods*, 1907. His pictures generally represent children in a landscape setting, rich in colour and decorative in purpose. He is represented in municipal collections, e.g. the galleries of Liverpool, Glasgow, Bradford, Leeds; Adelaide, Montreal, Toronto; Buffalo, St. Louis. He died in July, 1933.

Hornell. City of New York, U.S.A., in Steuben co. It stands on the Canisteo river, 92 m. S.E. of Buffalo, and is served by the Erie and other rlys. It is in the midst of a region which produces pota-

Horned Toad. A large South American batrachian, with horn-like projection over the eyes

toes and fruit. Industries include manufacture of textiles, hosiery, gloves, leather goods, wagons, farm implements, electrical machinery, tiles, and bricks, and there are also rly. workshops and foundries. Settled in 1790, Hornell was incorporated as Hornellsville in 1820, became a city in 1888, and received its present name in 1906. Pop. 15,649.

Horners' Company. London city livery company. Consisting of makers and sellers of drinking horns, hunting horns, lanthorns, powder horns, inkhorns, etc., it had been in existence for nearly 400 years when in 1638 it received its first charter. At that time glass was taking the place of horn, wood, and pewter. With it was amalgamated in 1476 the ancient guild of bottlers, or makers of leathern *botels*. The offices are at 3, Lawrence Pountney Hill, E.C.4. In the 20th cent. the company flourished greatly; the livery in 1947 being 300. It has a close association with the plastics industry, whose products

resemble those formerly made by the craftsmen in natural horn. The company grants an annual award for craftsmanship in plastics.

Hornet (*Vespa crabro*). Largest of the British wasps. It is found in the southern and midland counties of England, and is readily recognized by its reddish bands and markings, which replace the black of an ordinary wasp, and its large size, being nearly an inch in length. It

Hornet. 1. Male insect. 2. Queen

constructs its nest on the beams of outhouses or in holes in thatch, or preferably in hollow trees. Its larvae are partly fed upon captured bees and wasps. Its sting is severe, but it is not aggressive, and will rarely attack. *See Antennae; Wasp.*

Hornet Moth (*Trochilium apiformis*). Largest British representative of the clearwing moths. The wings are transparent like those of bees and wasps, owing to the absence of the scales which clothe those of other lepidoptera. In the hornet moth the margins of all the wings have a narrow border of brown scales, but the greater area is translucent with a yellowish tinge. The stout, elongated body is a clear yellow with several bands of blackish brown. The forebody is dark brown also. The large, orange-coloured hind legs are extended backward in a manner that greatly helps the protective resemblance to a stinging insect. The yellow-white, maggot-like caterpillar feeds on the wood of poplar trees. A somewhat smaller species, the lunar hornet moth (*T. crabroniformis*), is illustrated in the article *Clearwing Moth*.

Hornfels. Hard compact metamorphic rock formed by alteration of pre-existing rock by heat derived from nearby intrusions of igneous rock, such as granite. The original rock is completely recrystallised and earlier structures in it are commonly obliterated. Varieties are named after the new minerals that have developed in hornfels, e.g. *biotite*, *cordierite*, and *andalusite*. Alteration of lime-bearing rocks produces hornfels in which lime-silicate minerals predominate. Such rocks are often green or white. *See Metamorphism.*

Horniman, ANNIE ELIZABETH FREDERICKA (1860–1937). British theatrical manager. Born at

Horners' Company arms

Forest Hill, S.E. London, Oct. 3, 1860, daughter of F. J. Horniman, founder of Horniman's museum (*v.i.*), she studied art at the Slade school, and later became private secretary to W. B. Yeats (*q.v.*). In 1904 she leased the Abbey Theatre, Dublin, and in 1908 bought the Gaiety Theatre, Manchester, with which she was associated until 1921. A pioneer of the repertory theatre, she commissioned plays by St. John Ervine, Harold Brighouse, and many others. Long the leader of the little theatre movement, she was created C.H. in 1933. She died Aug. 6, 1937. See Abbey Theatre; Little Theatre.

Horniman's Museum. Museum in London Road, Forest Hill, London, S.E. The collection includes specimens of natural history, entomology, ethnology, costumes, and books. The surrounding grounds of 15 acres are laid out as a park, and the whole place was made free to the public in 1901. It was presented to the public by F. J. Horniman (1835-1906) and is a fine piece of architecture. It was damaged 1944 by a flying bomb

Horning, LETTERS OF. In Scots law, a procedure which could be used by a creditor to compel a debtor to pay his debt. Formerly the letters directed a messenger-at-arms to charge (*i.e.* order) the debtor to pay; if he failed to do so, the messenger denounced him rebel (*i.e.* an outlaw) by blowing three blasts with a horn at the market cross of Edinburgh or of the head burgh of the shire in which the debtor lived. His movables were then forfeit to the crown. The creditor could also obtain letters of caption authorising the imprisonment of the debtor. This ancient ceremony has long been disused. Although letters of horning without this ceremony may still be used, a creditor now normally proceeds under the Personal Diligence Act, 1838. Imprisonment for debt was with some exceptions abolished by the Debtors (Scotland) Act, 1880.

Hornpipe. Name of an obsolete reed instrument, popular in the Middle Ages, and also of a lively dance, which probably derived its name from the instrument. The dance was formerly in triple time, but about 1760 it was altered to common time, in which the melody has been written since. A well-known example is the sailors' hornpipe.

Horn Poppy (*Glaucium luteum*). Large annual or perennial herb of the family Papaveraceae. It is a

native of Europe, N. Africa, and W. Asia, growing on sandy seashores. The glaucous, leathery leaves are large and cut deeply into long lobes which are boldly

Horn Poppy. Flowers and giant seed-pods of this seaside plant

toothed. The yellow flowers are as much as 4 ins. across, and are followed by pods about 12 ins. long.

Horn Reef or Horns Reef. Reef in the North Sea lying off the coast of Jutland, Denmark. The great naval battle known as the battle of Jutland (*q.v.*) was fought in the vicinity, May 31, 1916, and is sometimes called the battle of Horns Reef.

Hornsea. British seaside resort. An urban dist. of the E. Riding of Yorkshire, it is 16 m. by railway N.E. from Hull, and on the North Sea. The council owns a floral hall, public parks, gardens, recreation grounds, and a boating lake. Defence works include sea walls in the form of promenades. Hornsea Mere covers over 400 acres and is the largest fresh water lake in Yorks. The parish church, built 1480, is dedicated to S. Nicholas. Pop. 5,000.

Hornsey. Parl. and mun. bor. and parish of N. London. It is in the co. of Middlesex, with a rly. station 4 m. N.W. of King's Cross.

Hornsey arms

Created a bor. in 1903, it includes part or all of the residential districts of Crouch End, Fortis Green, Harringay (the former name of the district), Muswell Hill, Finsbury Park, and Stroud Green. Alexandra Palace is within its borders. The manor belonged to the bishop of London before the Norman Conquest, as the name of Bishop's Wood reminds us.

In the time of Henry VI the lodge in Hornsey Great Park was a residence of the duke of Gloucester, and the scene of the alleged witchcraft referred to in Shakespeare's King Henry VI. Material from the old manor house of the bishop of London was used in building the 15th century church of S. Mary, rebuilt, excepting the tower, in 1832-33. The church contains interesting monuments. Samuel Rogers, the banker-poet, was buried in the churchyard. Near Muswell Hill is a cottage in which Thomas Moore once lived. Hornsey Lane leads to Highgate Archway. Hornsey returns one M.P. Pop. 96,584. See Highgate.

Horn Silver. This has been described as cerargyrite (*q.v.*).

Hornung, ERNEST WILLIAM (1866-1921). A British novelist. Born at Middlesbrough, June 7,

1866, and educated at Uppingham, he gained in Australia experience which is reflected in his earlier novels: A Bride from the Bush, 1890, and The Boss of Taroomba, 1894. Other stories are The Amateur Cracksmen, 1899; Stingaree, 1903; No Hero, 1903; Mr. Justice Raffles, 1909; The Crime Doctor, 1914. Excelling in the vigorous handling of sensationalism, he will best be remembered as the creator of Raffles, the gentleman burglar. This character was a success on stage and screen. Hornung died March 22, 1921.

Hornwork. Type of entrenchment or fortification providing two blunt salients towards the front and opportunities for considerable flanking fire. During the Middle Ages it was frequently used to protect gateways or other openings into a fortress.

Horology (Gr. *hōra*, hour; *logos*, word). Art and science of timekeeping. The uniform flow of time is measured by some regularly recurrent physical phenomenon. From earliest antiquity the apparent rotation of the heavens was used to fix the day, and the motion of the moon and the sun around the zodiac determined the month and the year respectively. Subdivision of the day into hours by the use first of the gnomon (*q.v.*) and then of the sundial was supplemented in cloudy weather and at night by water-

E. W. Hornung, British novelist
Elliott & Fry

clocks, graduated candles, and hour-glasses. The earliest mechanical clocks in the 14th century were regulated by no better device than a foliot balance. The clock was a poor timekeeper until Huygens in 1657 applied the pendulum (*q.v.*); he also made portable watches possible by using a spring-controlled balance wheel. In the 18th century, Harrison and Graham applied temperature compensation to the pendulum and the balance wheel, and there were parallel advances in the design of escapements. Graham's dead-beat escapement (1715) is still in common use, and Le Roy's chronometer of 1765 embodied the germ of most of the devices used in modern marine chronometers.

Modern methods for attaining extreme accuracy abandon the principle of mechanical oscillation in favour of oscillations in an electric circuit controlled by the vibrations in a quartz crystal due to piezo-electric effects. Such clocks at Greenwich Observatory achieved an accuracy to within 1/1,000 sec. a day. In 1949 the American Bureau of Standards demonstrated an atomic clock in which the crystal is checked against the vibration frequency of atoms in an ammonia molecule. It is believed to be accurate to at least 1/1,000,000 sec. a day. See *Calendar*; *Clock*; *Time*; consult *Science of Clocks and Watches*, A. L. Rawlings, 1944.

Horowitz, Vladimir (b. 1904). Russian pianist. Born in Kiev, he studied under Felix Blumenfeld, and made his first public appearance at the age of six. The brilliant success of a series of 23 recitals in Leningrad led to a European tour, and in 1928 he first visited the U.S.A. He settled there and married the daughter of Arturo Toscanini. By the 1940s his place was secure among the great pianists.

Horabin, James Francis (b. 1884). British journalist and artist. Born Nov. 1, 1884, at Peterborough, he became a metal-work designer, but joined the Sheffield Telegraph as an artist in 1906. In 1911 began his association with the London Star, for which he drew comic strips, the daily series Dot and Carrie first appearing Nov. 17, 1922. The Noah Family,

the daily children's feature which he drew for the Daily News, begun on June 13, 1919, was still appearing as The Arkubs in the News Chronicle over 28 years later.

J. F. Horabin,
British journalist
and artist

His talent for black-and-white found expression in the making of specialised maps and charts; he designed the television news map series. A lecturer in Labour colleges and editor of Plebs magazine, 1914-26, he was Labour M.P. for Peterborough, 1929-31. He illustrated Wells's Outline of History, and L. Hogben's Mathematics for the Million, and Science for the Citizen; and published An Outline of Economic Geography, 1923; Working Class Education (with his wife), 1924; A Short History of the British Empire, 1929, rev. ed. 1946; and topical atlases.

Horrocks or Horrox, Jeremiah (1619-41). English astronomer. Born at Toxteth Park, Liverpool, he was educated at Emmanuel College, Cambridge. He became a tutor and then a clergyman; but his main interest was in astronomy. He worked at a revision of the Rudolphine Tables and was the first to observe the transit of Venus on Nov. 24, 1639, which he alone predicted. His short career was full of activity; he undertook tidal observations and ascribed an elliptical orbit to the moon. He died, Jan. 3, 1641.

Horsa. British troop-carrying glider of the Second Great War.

It had a wooden framework for ease of production and a large box-like fuselage for maximum load capacity. The wing span was 88 ft. Load capacity was three tons of freight or a section of 15 fully armed and equipped men. Large numbers of Horsa gliders were used on D-day, in the Arnhem assault, and at the Rhine crossing.

For the Anglo-Saxon chief Horsa, see Hengist.

Horse. In geology, a mass of rock broken from one wall and caught between the walls of a fault. Masses of wall rock included in mineral veins are likewise named. They are sometimes enormous, and usually more or less lenticular or tabular in shape.

Horse. Family of the odd-toed ungulata, or hoofed animals, comprising the zoological order Perissodactyla. The horse family (Equidae) includes the horse, ass, zebra, and quagga, all closely related anatomically, but most usefully regarded as distinct species. They all interbreed, but the hybrids are almost invariably sterile.

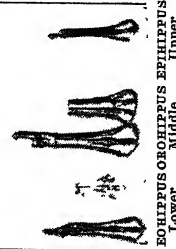

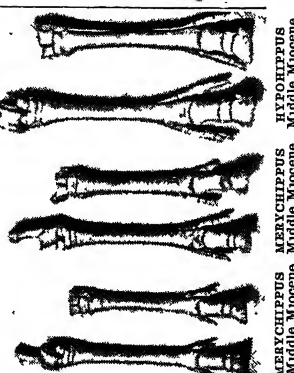

All the family are distinguished by the peculiarity that they stand on a single toe of each foot. Originally they had five toes, as is shown by the fossil remains of extinct horses—or rather ancestors of horses—but two toes have quite disappeared and the other two are now represented by the splint bones, two small bones lying close alongside the cannon bone and terminating just above the fetlock. The earliest known ancestor of the horse, Eohippus, was no larger than a hare, and remains have been found of a series of intermediate forms leading up to the modern animal.

Vladimir Horowitz,
Russian pianist

HORSE: STAGES IN THE EVOLUTION OF THE FEET OF THE HORSE AS REVEALED BY THE STUDY OF FOSSIL REMAINS

By courtesy of the American Museum of Natural History

The horse is distinguished from the ass and the zebra by the absence of striping, though a stripe is occasionally present on the back and rarely on the legs; the presence of chestnuts or warts on all the legs; and the even-haired tail, the hairs beginning close to the base, and not in a tuft at the extremity. It is also usually larger.

The horse now occurs in the wild state only in Mongolia, where Przevalsky's horse is found in large herds. This resembles a shaggy pony, with upstanding mane, and the hairs on the tail are short at the base and long at the tip, approaching the tuft seen in the ass and zebra. The evolution of the horse took place mostly in the Old World. In each great geological epoch the New World received horses from the Old, but always they died out. The mustangs of N. America and the so-called wild horses of the pampas of S. America are merely descendants of domesticated European animals that have strayed and taken to a feral life. A rather primitive type of wild horse formerly inhabited Great Britain, and some authorities think that the Connemara and Shetland ponies are its direct descendants. Numerous prehistoric carvings and sketches of horses suggest that more than one type of animal was then known. A few early sketches bear lines thought to represent primitive harness.

The Horse in History

In history we find the horse domesticated from the earliest periods, as shown by Assyrian and Egyptian sculptures. It is mentioned in the Pentateuch, but as an animal used by other nations than the Hebrews, among whom it seems to have been rare until the reign of Solomon. In Britain Caesar found that the southern tribes possessed cavalry, and also had scythe-wheeled chariots drawn by horses. These were probably Celtic ponies, as the larger types of horse seem to have been introduced by the Norman invaders. The Flemish war horse soon afterwards appeared, the heavy shire or cart horse rather later. The introduction of tournaments under Henry II, and of racing soon afterwards, developed different breeds.

In the reign of Henry VII a mare of fair quality could be bought for seven shillings. The increase in the weight of armour led to the breeding of horses of great bone and strength, and pack horses were largely in use for carrying goods. In the reign of Queen

Elizabeth the use of coaches became general, and the carriage type of horse was consequently developed, while the importation of Arabs, and the later improvement of roads, produced the lighter and more graceful breeds.

The domesticated breeds chiefly met with in Great Britain consist of riding, carriage, and cart horses. Riding horses include the thoroughbred, the hackney, and the pony; carriage horses are mainly Cleveland bays and coach horses; while the Shire, Clydesdale, and Suffolk punch are the three strains used for cartage and heavy work.

Of agricultural horses, the Shire horse, the direct descendant of the old English war horse, heads the list for size and weight. It is the largest horse in the world, standing 17 hands high, and often attains a weight of 2,000 lb. The fenlands of Lincolnshire and Cambridgeshire and the clay soils of Leicestershire produce this breed.

Though of immense strength, it is remarkably docile. Its legs are

exceptionally massive and well feathered, i.e. they have a covering of long hair from the backs of the knees and hocks to the pasterns. The neck should be well arched to the shoulders, the chest wide, the back short and straight.

Clydesdale and Suffolk Punch

The Clydesdale takes the place of the Shire horse in Scotland, and is very similar in general appearance, but smaller and of rather more slender proportions. It is said to be a cross between the old Scottish breed and the Flemish horse. It is less arched in the neck and more sloping at the shoulders than the English breed. The legs are feathered, and a white blaze on the face is usual. The breed combines great powers of endurance with activity of movement, and is very docile. At times it has been largely exported to the colonies and abroad.

The Suffolk punch is the agricultural horse of E. Anglia, where it has been bred since the 16th century. Its appearance is quite

unlike that of any other breed. It has a short head, remarkably deep and high-arched neck, very short legs, and a generally chubby shape—whence probably its name punched. It stands 16 hands high, and may weigh as much as the Shire horse. The breed having been kept pure for many generations, the distinctive characteristics are well maintained. It is always chestnut in colour, though the shades vary greatly. Owing to its hardness, great activity, and fine pulling qualities, it is highly valued, and in demand for export.

Of carriage horses, the Cleveland bay may be regarded as the foundation. It has long been bred in Yorkshire, and seems to have originated in crosses between the thoroughbred and common horses of the old breeds. It tends to show zebra-like stripes on the legs, which is supposed to denote purity of blood. But, following the analogy of what is usually met with in experiments in hybridisation, it would rather seem to suggest

exactly the opposite. The Cleveland bay combines a graceful appearance with the more useful qualities of a working animal. It is in great demand for crossing purposes to make hunters and chargers, and is largely exported.

The coach horse, or Yorkshire coach horse, was developed from the Cleveland bay over a hundred years ago, and is usually a dark bay with black legs. Mainly bred in Yorkshire, it has a considerable strain of thoroughbred blood. It stands 16 hands high, and is notable for its fine appearance and high-stepping action.

Artificial insemination makes it easy to produce in a short time many offspring from one stallion selected for desirable qualities.

Of saddle horses the thoroughbred heads the list. Its breeding has been absolutely controlled for over a century, during which time it has added some inches to its stature. It is seen in its finest form in the racehorse, and has a considerable strain of Arab blood in its composition. The most graceful of all the British breeds, though the extreme greyhound type has developed grace at the expense of more useful qualities, it stands about 16 hands high, should have a long lean head, sloping shoulders, short deep back, muscular quarters, and slender legs. A good racehorse can maintain a speed of 35 m.p.h. for a mile. Some 5,000 racehorses are bred yearly in the British Isles.

The hunter is often a thoroughbred, but is more frequently a cross between that breed and the Cleveland bay. It should preferably be either black or chestnut. Other things being equal, the bigger the hunter the better the price; but it is all-important that it should possess speed, and be good and quick at fences. Perhaps a quarter of a million hunters are bred annually in the U.K. and Eire, especially Kildare and Tipperary.

The Hackney or nag is an old breed, the records of which go back to the 14th century. It is a famous trotter, and was formerly much used as a saddle horse. Its leading feature is the high and free action. The rider should be able to see the knee advanced before

the breast, and the legs should be thrust well forward before the foot is placed on the ground. The cob is a sturdy, short-legged horse suitable for saddle work.

The pony is a small breed ranging in height from the nine hands of the Shetland

Horse Chestnut. 1. Flower spike of the tree. 2. A magnificent specimen in full bloom. 3. The spiked fruit

to about 14 hands. It is an ancient inhabitant of Great Britain, and still roams half wild on Exmoor, Dartmoor, and in the New Forest.

As a worker the horse is still of economic importance throughout the civilized world, in spite of mechanisation, no other draught animal being of such all-round usefulness. Though its flesh is perfectly wholesome and palatable, its use as a table animal is now greatly restricted.

The rearing of horses in Great Britain is more widely distributed among small breeders than that of cattle and sheep. Foals are generally too valuable to encourage the method, which works quite satisfactorily with common stock under careful management, of working mares while suckling. Apart from infectious diseases that affect domestic animals generally, the common diseases to which the horse is liable include founder or

laminitis, pink eye, ringbone, sand-crack, sidebone, splint, strangles, and staggers. See Animal; Evolution; Hippo-phagy; Mammal; consult also The Horse, Sir W. Flower, 1891; The Horse: Its Treatment in Health and Disease, J. Wortley Axe, 1906.

Horse Chestnut (*Aesculus hippocastanum*). Tree of the family Hippocastanaceae. Native of Asia and E. Europe, it averages 60 ft. in height, and bears pyramidal spikes of pink or white blossoms. After blooming the resulting seed, or nut, encased in its green spine-covered case, is the conker, dear to school-boys. Culture is easy in any ordinary soil, and increase is effected by planting carefully preserved conkers in the open, 3 ins. apart, in early spring. Horse chestnuts make particularly fine avenues. One in Bushey Park, Middlesex, is the finest in the world.

The red-flowered chestnut, known as *A. carnea*, is a hybrid between the common species and the N. American *A. pavla*.

The bark of the tree contains a glucoside aesculin which, in acid solution, exhibits a beautiful blue fluorescence, and has been employed occasionally in medicine as a febrifuge. See Angiosperm; Bud; Bushey Park.

Horse-flies (*Tabanidae*). Extensive family of moderate-sized to large dipterous insects that are active on warm sunny days. They are stoutly built with a large head and conspicuous eyes marked with golden green or purple. The females feed by sucking the blood of horses and cattle, and frequently attack man: the males do not suck blood. These are the largest British blood-sucking flies, the females of *Tabanus sudeticus* measuring up to an inch. The eggs are laid in masses on plants growing in water or marshy places and the larvae live in damp earth. Over 3,000 species are known and some 28 kinds occur in Great Britain. The name cleg, some-

Horse-fly. Enlarged specimen of *Tabanus sudeticus*

times given locally to horse-flies, correctly belongs to the closely allied *Haematopota*, often a scourge, especially in parts of Russia.

horse at the other end, and liberated by loosening a catch with which the grab is provided.

Horse Guards. Government building between Whitehall and St. James's Park, London, S.W. It contains the old offices and audience-room of the commander-in-chief, and since 1904 has been the headquarters of the commander-in-chief of the home forces.

There are two wings, with a clock-tower over an arch in the centre, the archway opening upon the Horse Guards Parade, a large open space, once the Old Tilt Yard, where tournaments took place in Tudor times, and where the ceremony of trooping the colour now takes place on the king's birthday. There is a memorial to the Guards' services in the First Great War on the west side, facing the archway, slightly scarred by German bombs of the Second Great War, as are statue memorials to Kitchener (on the S. side) and Roberts (E. side). A statue of Wolseley was so severely damaged that it was removed.

The mounting and dismounting of the guard (provided by the Life Guards or Royal Horse Guards) at 11 a.m. (10 a.m. on Sundays) and 4 p.m. are among the most familiar

of London sights. The building, erected 1750-54, took the place of a structure built in 1641 to serve as a guardhouse for the palace of Whitehall. It was severely damaged by enemy air action in the Second Great War. Only royalty or those on the lord chamberlain's list may drive through the gates to the park, but the passage is open in normal times to pedestrians. See Guards; Whitehall.

Horse Guards, ROYAL. Regiment of the British army. It was formed in 1661 from disbanded troopers of Crook's regiment of Cromwell's new model army. The Horse Guards became known as the Oxford Blues, because of the colour of their facings and because they were first commanded by the earl of Oxford. The regiment served at Sedgemoor, at the Boyne, and saw its first foreign engagement at Dettingen in 1743. It gained honours in the Seven Years' War and the Peninsular War and was present at Waterloo. It was in the charge at Tel-el-Kebir and fought throughout the S. African War. In the First Great War the Horse Guards served as both cavalry and infantry, fighting notably at Ypres.

At the outbreak of the Second Great War the Horse Guards and

Horse Guards' badge

6th armoured division in Italy. The 2nd formed a reconnaissance unit of the Guards armoured division in the liberation of Europe and the advance into Germany. At the end of the war, these two regiments reverted to their original titles of Royal Horse Guards, Life Guards.

Horsehair.

Tail and mane hairs of horses, tail hair having more value in commerce. As a preliminary operation the raw hair is sorted, tail and mane hair being separated and graded according to length and colour. Various grades are blended for production of different qualities. Some qualities are dressed for special purposes, for making brushes, seating for carriages and furniture, stair carpets, lawyers' wigs, etc. Specially long white hairs go into violin bows, and shorter white hairs into plumes for military head-dress. The remaining qualities, after washing and sterilising, are blended, spun, and curled into ropes, the hair thus curled being baked at a high temperature. The curled and baked rope hair is finally untwisted and carded by hand or machine, and, as it neither felts nor becomes matted, provides a hygienic filling for bedding and upholstery.

Horsehair

Worm. Popular name for the threadlike worms of the class Gordiacea, nearly related to the nematode worms. The eggs of the common horsehair worm of British ponds are laid in the water, and the larvae pass through two parasitic stages: the

Horse Guards, London. The building from St. James's Park. Upper picture, the frontage in Whitehall, showing the guard in the gateways

the Life Guards (*q.v.*) were amalgamated to form the 1st and 2nd Household Cavalry Regiments, and in 1941 went to Syria, where they were mechanised. The 1st served as an armoured car unit with the 8th army in N. Africa and with the

first in the bodies of aquatic snails and larvae, and the second in frogs, fishes, and water beetles. The adult is several feet long.

Horse Latitudes. Belts of calm air between the trade winds and the westerlies in each hemisphere.

Horse Guards. Trooper in full dress

They are marked by steady high barometric pressure and are centred about 30° N. and S. of the equator. From them the westerly winds blow polewards and the trade winds equatorwards. They are said to have derived their names from the fact that in the days of sail, when vessels were becalmed for long periods in these latitudes, any horses on board were thrown into the sea so as to save drinking water for the crew.

Horse Leech. Name applied to two distinct species of annelids related to the medicinal leech. In

Horse Leech, amid water reeds

Great Britain it denotes *Aulostoma* (or *Haemopsis*) *gulo*. It is common in ponds and streams, where it preys upon tadpoles, newts, molluscs, and its own kind. Its three jaws edged with minute teethlike serrations cannot pierce the tough outer skin of mammals, as do the harder, more efficiently toothed jaws of the medicinal leech. *Aulostoma* has only one pair of caecal appendages to the intestine, whereas *Hirudo medicinalis* has 10 pairs, in which food is stored.

The name horse leech belongs also to *Aulostoma* (or *Haemopsis*) *vorax*, of Europe and N. Africa, which attaches itself to the pharynx of horses, cattle, and men who may drink direct from streams. See Leech.

Horse Mackerel (*Trachurus*). Popular name for the scad, a common British fish which somewhat resembles a large mackerel, but belongs to a different family,

Horse Mackerel or Scad, a common British fish

Carangidae. It occurs in shoals, is often nearly 2 ft. long, has bony plates along the lateral line, and lacks the characteristic stripes of the mackerel. It is of little value for the table.

Horsens. Seaport of Denmark, in Vejle co., Jutland. It lies 32 m. by rly. S.W. of Aarhus and at the head of Horsens Fjord. The harbour is good and there is boating for pleasure. The chief build-

ing is a monastery of 1270. In the museum are exhibits of the Stone Age. Textiles and electrical apparatus are made and dairy produce shipped. Pop. 32,400.

Horse-power. Unit of mechanical power. In the early days of steam engineering the equivalent of 33,000 lb. raised through a distance of 1 ft. in 1 min. was adopted; though the energy output of a good horse is today taken as only four-fifths of 1 h.p. One h.p. is thus equivalent to 33,000 foot-pounds per min., or 550 per

sec.; 746 watts; 42.4 British thermal units; 1.014 metric horse-power.

"Indicated" h.p. of a reciprocating steam engine is calculated from a pressure diagram traced by an indicator (*q.v.*) connected to the cylinder or cylinders; it represents the power developed within the engine. "Brake" h.p. is the energy output (available for outside work) of the engine; it is measured by a dynamometer (*q.v.*) which the engine is caused to drive. See Steam Engine.

HORSE-RACING; A NATIONAL SPORT

V. R. Orchard ('Rapier' of Sport and Country, etc.)

This general sketch deals with flat racing. See Steeplechasing; the articles on the great English racing centres, e.g., Ascot; Goodwood; Newmarket; and those on the great races, e.g., Derby, St. Leger. See also Horse; Jockey; Stud Farm; Totalisator

England, the home of the thoroughbred racehorse, has been famed for its horses from pre-Roman days. Julius Caesar was surprised at the superior quality of the horses employed in battle by Cassivelaunus. Records of early racing, however, are scanty and the safest date to be attributed to its beginnings as a sport may be found in the writings of Bede, where there is a reference to youths "that might run and try which had the swiftest horse." Fitz Stephen refers to contests at Smithfield in the reign of Henry II. Richard II, when prince of Wales, matched his horse in 1377 with one ridden by the earl of Arundel; this is possibly the first horse race of which an authentic account has been preserved.

Importation of Eastern Horses

Henry VIII being a great patron of racing and breeding, by 1540 there was organized sport at Chester, Doncaster, York, Carlisle, and in Scotland; also racing in Croydon and in St. James's Park. Elizabeth favoured racing and the chase, and her subject, Gervase Markham, published a classic treatise: How to chuse, ride, traine and diet, both hunting-horses and running horses. The advent of the Stuarts heralded the development of the racehorse proper, with the "discovery" of Newmarket by James I and the importing of Eastern horses which became the foundation sires from which the modern racehorse has evolved. Racing was banned in the Commonwealth regime, but the breeding of thoroughbreds was not seriously affected.

Royalty continued its patronage of the sport in the post-Restoration period, its greatest protagonist being Anne. Development in the

Georgian era reached its zenith in the Regency, when vast fortunes were staked on the turf, the interest in which became one of the major occupations of the nobility and gentry. William IV and Victoria took a moderate interest in the sport, but Edward VII was one of its greatest patrons, winning the Derby and St. Leger with Persimmon (1896), the "triple crown" with Diamond Jubilee (1900), and the Two Thousand Guineas and Derby with Minoru (1909). George V raced and bred with success, and King George VI carried on the tradition with zest, winning in 1942 the wartime Two Thousand Guineas with Big Game and the One Thousand Guineas, Oaks, and St. Leger with Sun Chariot.

The origin of the thoroughbred, although disputed by one authority who attributes it entirely to the importing of Arab stock, is generally recognized to be the result of mating Eastern stallions with native running horses. Notable sires imported were the famous Darley Arabian, the Godolphin Arabian, and the Byerley Turk. From these trace, in tail-male, all thoroughbreds of the present day. The families (an expression when applied to bloodstock normally indicating female line of descent) inevitably branched with the development of scientific breeding. A great proportion of our modern racehorses traces to Eclipse (1764) a descendant of the Darley Arabian. The Herod line traces to the Byerley Turk and the Matchem line to the Godolphin Arabian.

The racehorse, whose training begins in his yearling days, will normally race at two years old and frequently to the age of seven. He is presumed to be a year old on

Jan. 1 in the year following his foaling date. The flat racing season opens in late March or early April and continues until Nov. Races for two-year-olds are held from the first day of the season. Modern practice tends to confine the number of these first-season races to half-a-dozen outings. The two-year-old may race at 5 furlongs and, as the season advances, at 6 and occasionally at 7 or more.

At three years, a colt or filly becomes eligible to run in the classic races. These are the Two Thousand Guineas, the One Thousand Guineas (for fillies only), the Derby, the Oaks (for fillies), and the St. Leger. The respective distances of the races are 1 mile; the same; 1½ miles; the same; 1½ miles. No horse has won all five classics. The filly Sceptre, in 1902, won all except the Derby. Successes in the Two Thousand Guineas, Derby, and St. Leger have been not infrequent, the winner being awarded the theoretical honour of the triple crown. Towards the end of the autumn, three-year-olds that stay well are normally saddled for races up to 2 miles and beyond; in these they may meet their seniors.

Tests for Four-Year-Olds

At four years, now reaching maturity, the colt or filly will run in handicap or conditions races (at fixed weights, often varied by penalties or allowances) at distances suitable to capacity. There are sequences of races designed to test four-year-olds, but the Gold Cup at Ascot (2½ miles), the Eclipse Stakes at Sandown Park (1½ miles), and the Autumn "cup" races, e.g. at Doncaster, may be cited as appropriate missions for high-grade horses. There are also important races, throughout the season, for sprinters. Despite a modern tendency to specialisation, the 19th century pattern may still be regarded as the Jockey Club's idea of what a good racehorse can do.

As an example may be given the record of Isinglass, 1892-95. Only once beaten, this model racehorse was foaled in 1890. At two he won a maiden plate at Newmarket, the New Stakes at Ascot, and the Middle Park plate at Newmarket. At three he won the Two Thousand Guineas, the Newmarket Stakes, the Derby, and the St. Leger. At four he won the Eclipse Stakes, the Princess of Wales's Stakes, and the Jockey Club Stakes. At five he won the

Ascot Gold Cup. His total winnings of £57,455 constituted a record. Many racehorses have completed their careers without being defeated. Eclipse never lost and never paid forfeit; Ormonde and St. Simon are other instances; a modern example is Bahram, triple crown winner of 1935.

Prize Money and Forfeits

Rewards, in the form of prize money, to the owner of a good horse are considerable. The Derby may be worth over £10,000; the St. Leger, Eclipse Stakes, and Ascot Gold Cup are similarly valuable events. Prize money for these four events in 1938 was respectively £9,229, £10,465, £8,868, and £7,600, not record figures. Prizes vary according to the entrance money contributed by owners; the system provides for forfeit stages, by which owners entering their horses may withdraw them at certain dates, the forfeited stakes going to the general pool. In Blue Peter's Derby (1939) 116 owners declared forfeit of £5 each; 110 at £25; 62 at £50. Owners whose horses remained in the entry paid £100 each. Further financial rewards accrue to owners of first class horses that are retired to the stud.

Conditions of races are varied so as to give winning chances to horses of all ages, classes, and capacities. Maiden events are designed for two-, three-, and occasionally four-year-olds that have not won, either at starting or by specified dates. Winners may be set to carry extra weights up to 14 lb. The classic races are run at equal weights, with the concession that fillies carry slightly less than colts. In other races, weight-for-age terms are imposed, based on a scale introduced by Admiral Rous in 1873. Weights include the bodily weights of the riders, adjusted by the placing of lead beneath the saddle cloths. The standard weight (for colts) in the classic races and other important events is 9 st. Handicap races are arranged for all types of horses, according to their estimated relative merits, the highest weight allotted being not less than 9 st. 7 lb. and the lowest 6 st. 7 lb. There are also selling races, the winners of which are sold on the spot at public auction. Races are graded in distance, the shortest being 5 furlongs and the longest approximately 2½ miles. A horse carrying 9 st. at Ascot will do well to cover 5 furlongs in just over a minute, a mile in 1½ mins., or 2 miles in 3½ mins. Some courses are faster, among them Epsom.

where the Derby (1½ miles) was won in 2 mins. 33½ secs. by Mahmoud in 1936.

The cost of racing depends on the type of horse and the sort of races in which it runs. A rough estimate for an average racehorse based on the comparatively stable period 1930-39 would be £300 per annum in training fees and a similar sum for entrance fees, forfeits, etc. All costs rose during and after the Second Great War. Owners are divided into two main classes: those who breed their own horses, maintaining private training stables, and those—the great majority—who buy yearlings and place them with public trainers.

There were in England in 1945 approximately 225 trainers, with establishments varying from two or three horses to 60 and over. The bulk of the training stables are concentrated near Newmarket, in the Berkshire and Wiltshire Downs, and in Yorkshire. Most gallops or training areas are used communally, individual trainers paying annual fees per horse, to cover maintenance costs. Trainers employ apprentices and a larger proportion of stable hands; it is usual for one stable hand to groom and ride at exercise a minimum of two horses.

Jockeys' Emoluments

Jockeys, licensed by the Jockey Club, are as a rule paid retainers by individual owners or trainers. Fashionable and successful jockeys may have several retainers. The official scale is 5 guineas for a winning, 3 guineas for a losing, ride. First-class jockeys, however, receive retaining fees running well into four figures and occasional presents in addition. The profession may be lucrative, but the work is extremely arduous and perhaps accompanied by the need for fasting in order to keep riding weights within limits.

The supreme authority in racing is the Jockey Club (*q.v.*) whose rules, first published in 1857, are substantially followed in every country in the world.

The control of racing, within the framework of the rules of racing, is exercised (a) by the stewards of the Jockey Club at meetings conducted by them, e.g. at Newmarket; (b) by local stewards appointed by racecourse executives. Racecourses, which must be licensed by the Jockey Club, may be privately owned, or managed by municipal bodies (e.g. Doncaster); the majority are profit-bearing concerns but sometimes profits go back to prize money or improvements of stands.

Officials, apart from the stewards, consist of paid secretaries, clerks of courses, and of the scales, handicappers, judges, stakeholders, starters, and club secretaries. Medical and veterinary officers are appointed to all courses. An inspector of courses is nominated by the Jockey Club.

Betting is conducted on racecourses by bookmakers and through the totalisator (*q.v.*). The bookmakers, who pay higher charges for admittance than the general public, are accommodated in an enclosure popularly known as Tattersall's Ring, where they conduct their lawful business; there is cheaper accommodation for them, and for the public, in the Silver Ring. A vast amount of off-course business is done by starting price offices in the towns, bets being made by telephone and other means on credit. Cash betting away from racecourses is illegal.

Racing in England in 1946 was conducted on 33 courses, and in Scotland on four. In the same year a total of 3,017 horses competed in Great Britain for 1,985 races, of which 1,195 were for two-year-olds. The total prize money competed for was £755,683.

Racing During Wartime

During the Second Great War most racecourses were taken for national purposes and racing was confined to a very few. By permission of the government, part of Newmarket Heath was kept open for racing and training purposes; substitute classic races were decided there. Racing was held only at Newmarket, Pontefract, Salisbury, Stockton, and Windsor in 1942, but other courses were brought into use as the military situation improved. The rationing of oats for racehorses was instituted in 1940 and was continued beyond the war. There was formed in 1942, at the instigation of the Jockey Club, a racing reorganization committee, whose terms of reference were to consider the whole future of racing in general and in particular the encouragement of owners and the greater comfort and convenience of the public.

Watson, 1904; History of the Racing Calendar and Stud-Book, C. M. Prior, 1926; Flat Racing, Lonsdale Library, vol. xxviii.

Horseradish (*Cochlearia armoracia*). Edible rooted perennial of the family Cruciferae. Probably a native of Central Europe, it has been cultivated from the earliest times, and is naturalised in Great Britain. It has flower stems about 2 ft. high surmounted by white flowers, large oblong basal leaves

Horseradish. Leaves and edible root of this vegetable

on long stalks, and lance-shaped stem leaves. Its cylindrical white root is used as an adjunct to roast beef, and in sauces. It is readily propagated by division of roots in any soil or position, but the best soil yields the hottest flavoured horseradish. Horseradish beds should be cleared out and replanted at intervals of three years, otherwise they tend to undermine neighbouring crops.

Horseshoe Fall. The Canadian section of the falls of Niagara (*q.v.*), separated by Goat Island from the American Fall. Horseshoe Fall is 158 ft. high, with a crest of 2,600 ft. in a long curve.

Horse Show. Public exhibition of horses, usually held under the auspices of some society. Prizes are given, on the advice of qualified judges, for the best animals. The most famous show is, perhaps, the one held at Ball's Bridge, Dublin, every Aug. The International Horse Show takes place annually, usually at Olympia, London. Other shows are for particular classes of horses, *e.g.* the Shire Horse Show is held at the Agricultural Hall, Islington, and there are shows for hunters, ponies, etc.

Horsetail (*Equisetum*). Genus of Pteridophyta of the family Equisetaceae (*q.v.*). Horsetails are natives chiefly of the N. temperate regions, a few species sub-tropical. They are the only surviving representatives of the trees of carboniferous times. They have creeping rootstocks and erect, hollow,

jointed stems (solid at the joints). They are coated with silica so completely that lengths may be found in ponds and ditches from which all the soft parts have been dissolved out, but the form is still perfect. Hence some species have long been used for scouring and polishing, and Holland exports Dutch rushes (*E. hyemale*) from dykes and canal banks for this purpose. See Botany.

Horse-trappings. Objects for controlling and decorating horses in peace and war. Swiss lake-dwellers used staghorn cheek-bars, with twisted thong or rope mouth-pieces. In the Bronze Age the twist reappeared in metal, unjointed or jointed; late-Celtic iron bits were often bronze-plated. Gold and silver trappings abound in Scythian graves. British sites—Polden Hill in Somerset, Stanwick in Yorkshire, and Hunsbury in Northants—yield bronze and iron bits, cheek-pieces, frontals, terrets, and rings. Tiny bronze bells from Dowris, Offaly, were probably harness jingles. At Goblin Hill, Flintshire, a Bronze Age cist contained a richly engraved gold pony-corslet. Most early British enamelling is associated with horse-furniture. See Bronze Age.

Horsforth. An urban dist. in the West Riding of Yorkshire, England. It stands on the Aire, 5 miles N.W. of Leeds, and is served by two railway lines. It is mainly residential, but bleaching and the manufacture of woollen goods are carried on. Pop. 13,000.

Horsham. An urban dist. and market town of W. Sussex, England. It stands near the head of the Arun, 33 m. S.S.W. of London on the electric rly. The church of S. Mary, an Early English structure, its tower dating from 1247, contains several fine monuments; some are of the Shelley family, the poet having been born 1½ m. away. There are a town hall, an old grammar school in a modern building, and an exchange. At Carfax, in the centre of the town, is an iron ring, the surviving relic of bull-baiting. In the Causeway are gabled houses. Tanning and milling are industries, and there is a trade in agricultural produce. The council owns the water and electricity undertakings and markets. Horsham was an important

Horsham arms

Horsham, Sussex. View showing St. Mary's church, parts of which date from 1247

place in the 12th century. Later gloves were made here. From 1295 to 1885 it was separately represented in parliament, and now gives its name to a parl. co. div. Market day, Wed. Pop. 13,579. Near is Christ's Hospital (*q.v.*).

Horsham. Town of Victoria, Australia. It stands on the Wimmera river, and on the main line between Melbourne and Adelaide, 203 m. W.N.W. of the former. It is the commercial centre for the district and has irrigation works. Pop. 5,600.

Horsley, Sir Victor Alexander Haden (1857-1916). English surgeon. Born at Kensington, April 14, 1857, he graduated from University College, London. During 1891-93 he was Fullerian professor at the Royal Institution; from 1886 surgeon to the National Hospital for Paralysis and Epilepsy; and from 1906 consulting surgeon at University College Hospital, where he made a reputation as practitioner in facial surgery. He was knighted in 1902. In 1916 he went to Mesopotamia (Iraq) as consultant to the British forces, and issued a strong indictment of the medical organization there, but died of heat-stroke, July 16. He was an advocate of temperance and women's suffrage.

Horst. High ground which owes its elevation directly to fault movements. Horsts are commonly elongated ridges bounded on either side by faults. They may have been pushed up from below, or the ground level on either side may have been lowered by vertical earth movements; *See* Earth Movement: Fault.

Horst Wessel Song. German Nazi party anthem. It was written by a young Nazi, Horst Wessel, who, according to the party, had been killed in a fight with Communists, but had actually met his death in a public-

house brawl. The air of the song, which was sung at the close of all official proceedings, was adapted from a German Communist party song, itself borrowed from a Salvation Army hymn.

Hort, Fenton John Anthony (1828-92). British theologian.

Born in Dublin, April 23, 1828, he was educated at Rugby and Trinity College, Cambridge. After distinguishing himself in several fields of scholarship, he was ordained 1854 and was a Hertfordshire vicar, 1857-72. In 1872 he became fellow and lecturer of Emmanuel College, Cambridge, in 1878 the Hulsean professor of divinity, and in 1887 the Lady Margaret lecturer in divinity. He died Nov. 30, 1892.

Hort is chiefly known for his work on the N.T., in which he was associated with Westcott and Lightfoot. One of the committee appointed to revise the text of the N.T., with Westcott he published the edition on which the R.V. was largely based; his introduction is an outstanding piece of critical scholarship. *Consult* Life and Letters, ed. Sir A. Hort, 1896.

Horta. Seaport of the Azores and capital of the island of Fayal, giving its name to a district. It possesses a good harbour, wireless station, and coaling facilities. Pop. 7,000.

Horten. Seaport of Norway, in the fylke or co. of Vestfold. It stands on the W. shore of Oslo Fjord, almost opposite Moss, 32 m. direct and 66 m. by rly. S. of Oslo. The adjoining Karl-Johansvaern is the chief Norwegian naval arsenal. There are ship-building yards, an observatory, and a nautical museum. Pop. 10,775.

Hortensius, Quintus (114-50 B.C.). Roman orator. A supporter of the aristocratic party, he held various high offices, including the consulship in 69. A representative of the Asian or bombastic style of oratory, and noted for his retentive memory, he was considered the greatest advocate of his time until surpassed by Cicero. He defended Verres (*q.v.*).

Horthy de Nagybanja, Nicolas Vitez (b. 1868). Regent of Hungary, 1920-44. Horthy was born at Kenderes, June 18,

1868, and educated at the naval academy of Fiume. After having commanded the Austrian fleet towards the end of the First Great War, he organized a White Army to fight the Hungarian soviet republic. The Communists were defeated, and Horthy assumed the title of administrator of the realm in 1920. Although he fostered friendship with Germany and Italy, he became neutral in 1939; but Hungary's adherence to the Tripartite Pact of Nov. 19, 1940, made her a satellite of the Axis powers.

When Hungarian troops invaded Yugoslavia on April 11, 1941, Horthy issued a justification. In Sept. Hitler and the regent conferred at the former's headquarters, with the result that Hungarian troops were sent to the Russian front. On Feb. 16, 1942, Horthy nominated his son Stephen as deputy-regent, but the latter was killed on the Russian front in Aug. The regent asked for armistice terms on Oct. 15, 1944, and was deposed next day, being transferred to Germany. He was captured at Weilheim, Upper Bavaria, by troops of the U.S. 7th army on May 1, 1945. Imprisoned at Nuremberg, he was released, again arrested at the request of Yugoslavia, held by U.S. authorities until 1948, then finally released, when he went to Portugal.

Admiral Horthy, regent of Hungary

Horticultural Society, Royal. Association established in 1804 to collect information about the cultivation of plants and trees and to encourage every branch of horticulture. It established a Journal in 1807, and was incorporated in 1809. Until 1928 its offices were the Royal Horticultural Hall, Vincent Square, London, S.W., and in that year a new hall was opened in Greycoat St., Westminster. It has gardens at Wisley, Surrey, inaugurated in 1903, where experiments are carried out in its laboratory and research station. The society has about 27,000 fellows and associates, and grants diplomas to gardeners, horticulturists, and teachers.

Horticulture (Lat. *hortus*, a garden; *cultura*, cultivation). The term under which are grouped all methods of gardening as practised in private, public, botanical, market, and experi-

mental gardens and plant nurseries. It embraces the cultivation of ornamental trees and shrubs, tree, bush, and cane fruits, vegetables, hardy and half-hardy flowering plants, alpine plants suitable for the greenhouse and conservatory, and flowers and vegetables for the production of seeds.

Commercial horticulture is an industry employing large numbers of men and women in growing fruits, vegetables, and flowers for the markets, and in nurseries where plants are propagated on a large scale. Another important business is cultivating flowering plants and vegetables for the seeds used by professional and private gardeners. Horticulture since the beginning of the 20th century has become highly specialised. Public parks and gardens, a feature of all large towns, are under the care of superintendents who have undergone special training.

Courses for students of horticulture are held in the Royal Botanic Gardens, Kew; the Royal Horticultural Society's gardens at Wisley; Wye college; and the women's college at Studley. Experimental work is carried on at the John Innes horticultural institution, Herts; E. Malling and Long Ashton research stations; Seale-Hayne College; and Reading university. Insecticides and fungicides have been improved by researches carried out by horticultural chemists. The national diploma in horticulture, equivalent to a degree in gardening, is awarded by the Royal Horticultural Society. Flower societies further the production of special blooms, fortnightly exhibitions are held in London by the R.H.S., and horticultural shows draw crowds to Southport, Shrewsbury, Edinburgh, and Leicester. Botanical exploration has enriched the British collections of plants with introductions from China, Assam, Burma, and other countries. New and improved fruits, flowers, and vegetables have been raised by hybridisation in garden or nursery.

Horton, ROBERT FORMAN (1855-1934). British Congregationalist divine and writer. Born in London, Sept. 18, 1855, he was educated at Shrewsbury school and New College, Oxford. In 1880 he accepted an invitation to become minister of a new church, formed by the Congregationalists at Hampstead. A building was erected in Lyndhurst Road, and Horton soon won

a reputation as a preacher and as an organizer of social activities. In 1903 he was chairman of the Congregational Union. Although a D.D., he regarded himself as a layman, his attitude being that a separate priesthood was unnecessary. He became known as a theologian, taking somewhat advanced views on the inspiration of the Bible. His writings include *Inspiration and the Bible*, 1888; *The Teaching of Jesus*, 1895; *Oliver Cromwell*, 1897; *The Hero of Heroes*, 1911; *Autobiography*, 1917. Retiring in 1930, he died March 30, 1934. *A Life by A. Peel* appeared in 1937.

Horus. Egyptian deity. Hawk-headed, he was perhaps the totem of a hawk clan, whose victory originated the Horus-name borne by the dynastic kings, afterwards being deemed a sun-god, the son of Hathor. As Horus the child, the Greek Harpocrates, he appears in human form; sometimes, under Buddhist influence, on a lotus blossom. *See Egypt; Osiris.*

Horvath, MIHAIL (1809-78). Hungarian historian and statesman. Born at Szentes, Oct. 20, 1809, Horvath was ordained, became professor of Hungarian at Vienna in 1844, and was appointed bishop of Csanad in 1848. An ardent supporter of Hungarian independence, he was made minister of public instruction and worship after the rising of 1848, but after the Hungarian defeat was forced into exile. Although condemned to death, he returned under the amnesty of 1867, and later entered the diet, a supporter of Deák. He died at Karlsbad Aug. 19, 1878. Among his historical works are *History of the Hungarians, 1842-46*; *History of Hungary, 1859-63*.

Horwich. Urban dist. and town of Lancashire, England. It is 5 m. W. by N. of Bolton, on the railway. There are large locomotive

Horwich arms

works here. Other industries include coal mining, stone quarrying, bleaching, cotton spinning, and dyeing. In the vicinity are the Rivington Reservoirs and Rivington Pike (alt. 1,500 ft.). Pop. 15,680.

Hosanna. Word derived from the Hebrew *hoshēa na anna*, Save (us) we pray (Ps. 118). From the use of the words Save, we pray, used on that occasion, the last day of the feast of Tabernacles was

known as the Great Hosanna. The word Hosanna, which acquired a kind of liturgical use as an exclamation of praise, was shouted by the assembled crowd as our Lord entered Jerusalem on Palm Sunday (Matt. 21, Mark 11, John 12). A kind of equivalent to the Roman *Io triumphe!* it is retained in the Sanctus of the Mass, and is used in the hymns for Palm Sunday.

Hose. Covering for the legs and feet. The term formerly included the breeches or chausses when both were a single garment. Early in the 16th century the two became separate articles, the upper part being known as the upper stocks or trunk hose, and, later, breeches, and the lower as the nether stocks, and afterwards as stockings (*q.v.*). *See Hosiery.*

Hose. Flexible pipe for the conveyance of fluids, often between a fixed and a moving point. The principal types of hose are: (1) plain rubber, or rubber reinforced with layers of canvas; (2) canvas; (3) leather with riveted seams; (4) armoured, consisting of rubber or canvas protected from wear and sharp bends by wire wound spirally round it from end to end. For high pressures of liquids or gases the walls are specially strengthened. Suction hose is that through which a fluid is drawn by suction; it is protected from collapse by extra-rigid wall construction, or by a wire wound layer.

The principal uses of hoses are in connexion with water, *e.g.* a garden hose, fire-engine hose, and water crane hose for watering locomotives; with oil, as for connecting the pumps of an oil-tank steamer to an oil-pipe line; with petrol, etc., in filling the tanks of motor vehicles from a pump; with steam and air, as applied to the steam and air connexions between the vehicles of a train; with air for the power supply to pneumatic tools, and in sandblasting, cleaning, etc.

Hose reels are revolving drums upon which lengths of *e.g.* garden hose or fire-engine hose are wound. Hose connexions, where high pressures occur, are made by flanged and bolted joints; for coupling the flexible hose pipes on the brake system between railway vehicles a clip is attached to the end of each length. By placing the two clips together and giving them a part turn, they are quickly coupled together.

Hosea. One of the minor prophets of the O.T. He was a son of Beeri, and was born in the Northern kingdom of Israel, of

which he is the only prophet whose utterances have survived in book form. He flourished in the reigns of Uziah, Ahaz, and Hezekiah, and of Jeroboam, king of Israel.

The first three chapters of his book consist of a parable, related as a personal incident, which symbolises the exile of Israel and its restoration. The remaining chapters contain a series of prophecies, evidently of different periods, in which Hosea laments the immorality and idolatry of the people and their political strifes. He strongly emphasises the love of God for His people, and the fact that He demands loving-kindness rather than sacrifice. In this Hosea introduces a new note into Jewish theology. His style is obscure, and the book as we now have it appears to contain many later interpolations.

Hoshangabad. District, subdivision, and town of India, in the Narbada division, Madhya union. The district has a number of cotton ginning and pressing factories. Wheat is the principal crop, the exports consisting mainly of agricultural produce, and the imports salt, sugar, and rice. Hoshangabad town is a local trade centre. Area of district, 5,707 sq. m. Pop. of district, 823,585, mainly Hindus; town, 13,290.

Hoshiarpur. District, subdivision, and town of India. In the Jullundur division, E. Punjab, it has the Beas and Sutlej rivers to form part of the boundary. Wheat, grain, and maize are the chief crops, and the chief industry is the manufacture of cotton goods. The tribes are Jats, Rajputs, and Gujars. Area, district, 2,195 sq. m. Pop. district, 1,170,323; subdivision, 322,000; town, 43,000.

Hosiery. Knitted goods of all kinds. In hand-knitting a loop is formed upon a plain needle and is caused to intersect with another loop, the work continuing one stitch at a time in horizontal rows, a fabric of interdependent loops being the result. In 1589 the Rev. William Lee, of Calverton, Notts, introduced his knitting frame for forming a whole row of loops at one operation. The thread was laid along a row of horizontal needles made of spring wire and hooked at the ends. The thread was pressed by the action of sinkers into loops hanging between each of these needles and was simultaneously slipped under the beads or hooks of the needles. The loops of the previous row were then pushed over the closed beads and thus over the ends of the needle, making a continuous flat web of

fabric, capable of being sewn into tubular and other shapes.

These main principles are still observed, although important additions have been made. Moses Mellor of Nottingham adapted the knitting frame to rotary principles. Means of narrowing or fashioning the fabric were added, and eventually vertical needles were employed and seamless stockings were then made. William Cotton's rotary frame has been chiefly instrumental in enabling high class fashioned hosiery to be produced at little cost. Townsend's needle carrying a small hinged latch, invented 1856, facilitated the production of cheap and fancy goods. Warp knitting machines, forming vertical rows of loops intersected between threads stretched warpwise, make both plain and fancy fabrics. Knitting machines of a high automatism turn out fully fashioned stockings in various stitches requiring only to be cut apart and seamed at the toe; also multicoloured and patterned fabrics of the fair isle type.

Hosiery goods are made to certain gauges, the gauge being the number of needles in one inch, and in several materials, chiefly wool, cotton, and silk. Undergarments such as singlets and drawers are the principal product. In addition to hose, knitted coats, sweaters, jerseys, gloves, neckties, caps, shawls, and waistcoats are made extensively. Leicester is the principal seat of the British industry; a high class of goods is made in Nottingham; Hawick is the chief centre in Scotland. Articles are hand-knitted for sale in N. Scotland and command higher prices

than similar machine-made goods. The knitting of cheap cotton articles is carried on in Saxony, U.S.A., and Japan. *See* Knitting.

Hoskins, JOHN (d. 1664). English miniature painter. Employed at the court of Charles I, he executed miniatures of the king and queen, the countess of Dysart, and others of the royal entourage. Alexander and Samuel Cooper were among his pupils. He is credited with some early portraits in oils. *See* Miniature.

Hosmer, HARRIET GOODRUE (1830-1908). American sculptor. Born at Watertown, Mass., Oct. 9, 1830, daughter of a doctor, she studied art in Boston, and later in Rome, where most of her life was spent. Her sculpture, in spite of a certain coldness of feeling, shows considerable structural sense. Examples are to be seen in the Metropolitan Museum of New York, and at St. Louis, while at Ashridge Park, Herts, are gates made after her designs. She died at her birthplace, Feb. 21, 1908.

Hospice (Lat. *hospitium*, place of entertainment). House of shelter for travellers in a dangerous country. The best known hospices are in the Swiss Alps, instituted probably for the sake of pilgrims going to and from Rome and maintained by monastic orders. The Great St. Bernard hospice, founded in 962, is noted for its rescues of travellers overtaken by cold and the breed of dogs trained to the work. Others are the St. Gotthard, started in the 13th century, the Simplon, the Little St. Bernard, and the one on Mont Cenis. Homes for the destitute and sick are also called hospices.

HOSPITAL: HISTORY AND TYPES

* H. A. J. Lamb, A.R.I.B.A., Editor, *Hospital and Health Management*

In addition to this general sketch there are articles on all the great hospitals, e.g. Guy's, London, St. Bartholomew's. See Ambulance; Medicine; Red Cross; and the articles on Diphtheria; Tuberculosis; and other diseases; also Hôtel Dieu

The art of healing and the care of the sick has, during the greater part of the known history of the world, been associated with religion, or what stood for religion. The Asklepiadae, the supposed descendants of Asklepios (Latinised as Aesculapius), who was worshipped as a god by the Greeks, were an order or caste of priests. The knowledge of medicine was regarded as a sacred secret to be transmitted from father to son in these families.

Hippocrates (c. 460-377 B.C.), celebrated physician of antiquity, in his famous professional oath, swears by "Apollo the Healer, and

by Asklepios, and all the gods and goddesses." In Cairo Museum is to be seen a sepulchral stèle of a physician to a royal hospital of the time of the Pharaohs. At Philae, a part of the temple was dedicated to I-em-hotep, whose name in later times became synonymous with Asklepios, but, generally speaking, the mental attitude of the pagan world to the sick was indifferent or actively selfish, and, although the sick betook themselves to the temples for cure, a hospital in any shape approaching modern institutions was not established until some time after the beginning of the Christian era.

modern hospital, treatment under these branches and remedial massage are widely used.

Voluntary hospitals have existed for centuries and have distinguished themselves by quality of work and initiative. Their constitution is flexible; they provide an atmosphere in which individual effort and enterprise can flourish. Under their aegis, and through their training schools, British medical and nursing professions have reached a high standard. Hospitals like Guy's, the London, S. Bartholomew's, and S. Thomas's—the last very seriously damaged by bombs in 1940—are household names in Great Britain.

Mental Hospitals

Except in a few instances, voluntary hospitals have not been provided for mental, chronic, or infectious cases. But as regards mental hospitals, the Society of Friends founded about 1791 the Retreat at York. Then humane methods of treatment began. In 1808 an Act gave authority for the provision of asylums. But it was not until Lord Shaftesbury intervened on behalf of these unfortunate people, becoming chairman of a lunacy commission in 1834, that progress was made. His energies laid the foundations of the Act of 1890, which is the basis of administration of mental hospitals today. In 1930 a more progressive Mental Treatment Act was passed, and further reforms can be effected under the National Health Service Act, 1946. Mental hospitals are arranged on the villa system, separate units, separately staffed, being scattered in enclosed park land. This arrangement permits of patients of similar type being nursed together.

Hospitals under local public government have developed since the passing of the Local Government Act, 1929, and to meet the needs of war casualties, both civilian and service. The number of general patients in them exceeds the number in voluntary hospitals, and they are almost wholly responsible for patients suffering from mental and infectious complaints.

In France, Germany, Scandinavia, and other W. European countries, voluntary hospitals are provided both by religious and philanthropic bodies, and in the countries with large R.C. populations many hospitals are staffed by religious communities. In the U.S.A., broadly, hospitals take in all classes of the community, the wealthy, in private or semi-private wards, contributing a sum which

with other resources helps others to secure benefits at a low charge or free. In Canada many hospitals are maintained on the same lines as in the U.S.A., but a number receive a state grant and payments are made by municipalities towards maintenance of patients. Each Australian state has its own method of dealing with the question, but there is one point of resemblance—all hospitals are more or less dependent upon the state government for funds. New Zealand municipal bodies have a voice in the management of hospitals, and, with the government, find the bulk of the funds.

The disadvantage of building hospitals in populated surroundings is apparent. To avoid noise, it is desirable that they be sited on the outskirts of towns, with ample grounds for future expansion. Transport facilities are important. All hospitals should be easily accessible by road and rail. Buildings should be designed to inspire confidence and cheerfulness, with strong clean lines and large windows, relying for effect on mass and not on detail. Patients now go to hospital in order to get well, not to die.

Vertical Planning

Ideals in planning hospitals are flexibility in the disposition of rooms and walls, and few corridors with every care taken to eliminate noise. One method of flexible planning is the "grid" system of spacing units, with light movable internal walls that can be adjusted to suit new needs. For a large central hospital, vertical planning is probably best, especially if the foundations are on rock. It is also more economical. An outstanding event of 1938 was the opening of the Birmingham hospital centre (later named the Queen Elizabeth hospital), a striking example of vertical planning, with novel ideas in the arrangement of operating theatres. See Birmingham illus., p. 1175.

The number of beds to a ward varies, but 18 to 24 is common; the tendency being towards smaller wards, as more homely. There are two methods of placing the beds. They can either have heads against the outside wall, with an allowance of 100-125 sq. ft. per bed, or be placed parallel to the external walls in groups of four, with steel and glass screens dividing one group from the next. The principal advantage of this latter method is psychological. It also allows more window space. It was introduced into England at the Hertford

county hospital. Risks of cross infection can be avoided by having no communicating corridors, open balconies for patients, and corridors at the back for staff use.

The increasing use of X-rays necessitates more accommodation for equipment. Suites desirable are barium meal, enema, and heavy bone; chest; surgical unit; small bone and skull, and, when necessary, dental; film processing, viewing, reporting, and records; waiting and rest rooms. There should be dressing-rooms to every suite.

The kitchen is most important. Many hospitals have heat storage cookers with solid fuel, or draw-back ovens. Others have wall or central ranges for solid fuel, gas, or electricity. Wired glass hoods, with extract ducts, placed over cooking equipment draw off all cooking odour.

Walls and Floors

Rubber in vulcanised tiles is popular for flooring wards and corridors as it reduces noise. This also applies to cork linoleum, which is germ-resisting, but needs careful laying. Teak strip and wood blocks are also used. Sanitary suites and operating theatres should have hard floors of tile, or terrazzo. If laid with ebonite fillets, cracking is prevented. The walls should be finished with a hard plaster and glaze-painted, with tiled dadoes in some departments. Dust traps should be avoided, and doors should be flush panelled.

The disadvantage of many heating systems is the presence of pipes which harbour dust and disfigure walls. Panel heating is popular because of the absence of pipes; it consists of steel tubing concealed by ceiling or floor grids, through which hot air circulates.

Ward lighting may consist of pendants with diffused shades, and bedhead lights; or a combination of direct and indirect lighting. Skirting or floor lights for night use are desirable. Operating theatres should have a high intensity of shadowless light.

Sanatoria should be easy of access from the districts they serve, and sited in places free from fog and dust, though not necessarily among pine trees. Planning should be approached from the point of view of the medical superintendent and the ratepayer, as well as the patient.

Quarters for nurses and domestic staff should be homely and attractive, near the hospital, but screened from it, with own garden. It is usual to have separate rooms for the staff, and self-contained

flats for senior members. There is a growing demand, however, for senior members of the nursing and domestic staff to be allowed to be non-resident.

From the heavy scars borne by British hospitals after the Second Great War it may seem that the needs of the public can best be served by the establishment of health centres, in which the main features would be preventive medicine and social hygiene. Here there should be ample facilities for enjoyment, and bureaux for discussions on bodily health problems and maternity clinics. The clinic which signifies a special department of a hospital, e.g. that for treating venereal disease, should not be confused with a clinic provided for the welfare of the people. The word is of Greek origin, and referred originally to the bedridden person or inmate of a hospital. The ideal combination is found in Bristol, where health and public assistance committees coordinate their medical services and provide for their patients a central health clinic.

There are good arguments for and against voluntary hospitals being taken over and managed by a state department or under local government. The hospital point of view is that the voluntary system may be said to have a soul, every hospital-trained doctor, nurse, and social and other worker being imbued with the idea that the patient comes first. It is felt that a state or municipal system might possibly lead to more mechanical, less humane, administration and treatment.

Yet, particularly since about 1912, national services concerned with the individual have been built up with increasing momentum. Greatest of these was the national health insurance scheme, which between 1912 and 1948 provided general practitioner service for all workers earning up to £420 per annum, and additional benefits over a limited and varying field. School medical and child welfare services were also brought into being. Hospital services were developed so as to isolate infectious sick. After 1930 the old poor law hospitals were brought within the administration of many local authorities.

A White Paper on a national health service appeared in 1944, and showed what was meant by a comprehensive service, how it would fit in with what had been done in the past, and what was being done. The change of govern-

ment in 1945 delayed legislation, but a bill providing for the establishment of a comprehensive health service became law in 1946. The administration of all hospitals, other than teaching hospitals, is entrusted to regional health boards. Each region is such that its services can be conveniently associated with a university medical school. Each board is required to appoint a local hospital management committee for each large hospital or related group of hospitals. Special arrangements are provided for hospitals or groups designated by the minister of Health as providing facilities for undergraduate or post-graduate clinical teaching. The general system does not cover the teaching hospitals, which have their own separate boards of governors, including members nominated by the university, the regional board, and the senior staff of the hospital itself. The cost of the scheme was previously estimated at £152,000,000.

Under the Health Service Act almost all voluntary and public hospitals were transferred to the minister of Health, July 5, 1948. This does not apply to the endowments of voluntary hospitals, which passed to a new fund. The service includes health centre and family doctor services, in which personal advice on health and treatment by doctors and dentists can be made at the patient's choice. Hospital and consultant services are made available not only at hospitals, institutions, and clinics, but also, where necessary, at health centres and the patient's home.

Hospitallers, KNIGHTS, OR KNIGHTS OF S. JOHN OF JERUSALEM. Order founded or sanctioned by Pope Paschal II in 1113. Its nucleus was formed in the services of a hospital founded originally for tending pilgrims. To this hospital sun-

Hospitallers. Badge of the Knights of S. John of Jerusalem

dry ardent and self-denying spirits attached themselves after the capture of Jerusalem by the first crusaders. To the vows of celibacy, chastity, and poverty common to religious orders were attached vows of military service, primarily for the protection of pilgrims and ultimately for the defence of the Holy Sepulchre. Like the Knights Templars (q.v.) who were founded shortly afterwards, the order was joined by many men of birth and rank.

The two orders became rivals, both playing an active part in the history of the Crusades. But at the beginning of the 14th century the establishment of the Templars in France, England, and elsewhere was suppressed. In 1291 the Hospitallers were compelled to relinquish their hold upon Acre and to retire to Cyprus. In 1310 they captured Rhodes, which they held as the advance guard of Christendom against the Turks, until it was conquered by Suleiman the Magnificent in 1522. They retreated to Crete, whence they were transferred by Charles V to Malta in 1530; after which they became known as the Knights of Malta. They retained the island until the knights were dispersed when Napoleon took possession of it in 1798 on his way to Egypt, after which it passed into the possession of England. The existing English order is engaged in organizing hospital work. See Red Cross; S. John of Jerusalem.

Hospital Ship. Vessel used for the transport of the sick and wounded of the armed services.

In the Royal Navy such ships are often used as floating hospitals to receive and treat casualties until they are fit to return to duty, or, if their recovery is likely to be delayed, until they can be transferred to a base hospital. Nor-

Hospital Ship. H.M.S. Maine, one of the British hospital ships used during the Second Great War

mally the function of a hospital ship is to bring wounded to a base hospital or to return them to their own country. During the N. Africa campaigns of the Second Great War, hospital ships took wounded from the advancing battle to base hospitals in Egypt, as distance and road conditions prevented transport by land.

In peace only a few hospital ships are kept in commission. The wartime hospital ship is generally a passenger vessel converted for the purpose, with swinging cots, hoists for patients, and all the usual hospital equipment, dispensaries, and dressing, operating, and X-ray rooms. In size they range from small boats to ocean-going liners. The medical and nursing staff are provided by the army or the navy, according to whether the ship is administered by the war office or the admiralty. Navigation and engine room staffs are merchant navy personnel; no officers or other ranks of the fighting services may be carried except as patients.

By the Hague Convention of 1907, hospital ships must be painted white with a broad horizontal band of green; if supported by private individuals or societies, the band must be red. The ship must fly the Red Cross as well as her national flag. A later amendment requires large red crosses, which can be illuminated at night, to be fixed to decks and hatches, clearly visible to aircraft. When a hospital ship is lying in port or anchorage she must maintain black-out precautions. Hospital ships must not be used for any purpose of offence or of transport (except the transport of medical stores). Their names must be communicated to the belligerent states.

Although a signatory of the Geneva Convention, Germany repeatedly flouted its clauses relative to hospital ships in both Great Wars. At Dunkirk in 1940 and Anzio in 1943, hospital ships embarking Allied wounded were deliberately attacked by aircraft in daylight. Over 100 British hospital ships were in service in the Second Great War.

Hospital Sunday. Day on which traditionally the offertories collected at churches and chapels of all religious denominations are put into a fund for the benefit of all medical charities in the district. Collections made for specific institutions after appeal from the pulpit were for long customary. At Aberdeen since 1784 the con-

gregations of all denominations have devoted their alms on the first Sunday of the year to the Aberdeen Royal Infirmary.

Universal collections for voluntary hospitals are more recent. The credit for the first suggestion of one belongs to T. B. Wright, one of the proprietors of the Midland Counties Herald, who proposed it in an article in that paper, Oct. 13, 1859. Canon Miller, then rector of Birmingham, supported the scheme, to the elaboration and working of which he devoted much time and ability, being one of the honorary secretaries of the Hospital Sunday Fund, then started in Birmingham, from its commencement until his removal to Greenwich. The Wright Cottage Hospital at Perry Barr, Birmingham, and the Miller Memorial Hospital at Greenwich commemorate the connexion of those two men with the Hospital Sunday Fund movement, which very soon spread through nearly every English-speaking population in the world.

In 1872 Thomas Wakley, editor of the *Lancet*, urged on the lord mayor and clergy of London the duty of organizing a Metropolitan Hospital Sunday Fund, and as a result of a meeting at the Mansion House the fund was instituted, the first annual collection taking place June 15, 1873. This fund has its headquarters at the Mansion House, and its annual receipts rose to £60,000-£70,000; following the nationalisation of hospitals in 1948, however, changes in the organisation were mooted, and in 1949 the receipts fell to £39,500.

Hospital Train. Railway train adapted and used for the conveyance of sick and wounded in wartime. Early hospital trains were generally rough improvisations, but during the First Great War a high standard was reached, and ambulance trains were an essential part of the army medical service, carrying up to 650 casualties.

Shortly before the Second Great War, the four main rly. companies in Great Britain undertook to equip for the war office ambulance trains for home and overseas use. In the first months of war, 12 home and 13 overseas ambulance trains were available; nine of the last, shipped to France, were lost in the retreat to Dunkirk. Ambulance trains were little used in the African and Pacific campaigns, but 66 were built at rly. workshops for the British and U.S. armies after D-day. Each train was equipped with furnished cars for travelling staffs of doctors,

nurses, and orderlies, kitchens and pharmacies, and wards for stretcher cases. The train crews were rly. employees, but the medical personnel were military.

In addition to the military ambulance trains, the rlys. provided 34 civilian casualty evacuation trains which were stationed at strategic points in the U.K. for the removal of civilians injured in air raids. As they were never needed for this purpose, most were transferred to the military authorities. A total of 925 vehicles were converted, and between June 6, 1944, and May 8, 1945, ambulance trains in Great Britain made 1,800 journeys. See *Ambulance* illus.

Host (Lat. *hostia*, victim). A term used in the Vulgate or Latin version of the Bible for the animal offered as a sin offering, burnt offering, or peace offering. In the R.C. Church the term is applied to the consecrated wafer, believed to be the Body of Christ, which in the Mass is offered as a sacrifice. It is used also of the bread before its consecration. It would appear that in the old Spanish liturgy the unconsecrated elements were known as *oblata* (things offered). The Greek Church uses unleavened bread, the R.C. a wafer of unleavened flour; in the Church of England, while High Church practice favours wafer bread, the rubric enjoins the use of "the best and purest wheat bread that conveniently may be gotten." See *Communion*, *Holy*; *Eucharist*; *Mass*; *Real Presence*; *Transubstantiation*.

Host. In pathology, the animal or plant upon which a parasite lives. Parasites usually produce disease in the host, completely destroying the ichneumon fly and certain caterpillars, impeding the growth of others. The mistletoe is a well-known plant parasite, its host being usually the apple tree. In wheat rust, wheat is the host, rust a parasite. See *Parasite*.

Hostage (old Fr., mod. *otage*).

In war, a person held by one of two belligerent forces as security for the performance, or the non-performance, of specified acts by the other. The practice, universal and of immemorial antiquity, was an obviously convenient method in former times of securing faithful and prompt fulfilment by the vanquished of conditions imposed by the victor. At first, no doubt, it was employed to prevent procrastination in completing surrenders and in negotiating terms of peace, but the Romans extended this use and held hostages of rank as guarantee for the continued loyalty of

subjected peoples. Modern European powers, Great Britain among them, have employed the same method in dealings with less civilized races, but as between civilized powers hostages have not been held for the performance of treaty obligations since the middle of the 18th century. Hostages are now usually taken only by invading troops as a preventive measure against hostile action by the non-combatant population of occupied areas, and as security for the payment of levies or fines imposed upon towns or districts by the occupying enemy.

The taking and execution of hostages were revived in their most barbarous forms by the Germans during their occupation of European countries from 1940. Local inhabitants were arrested and held as hostages for the cooperative behaviour of their compatriots compelled to work for the German war machine. In the event of sabotage, a number of hostages would be executed. When any German official or collaborator was assassinated by patriots, prominent citizens would be arrested, and some each day executed until the persons responsible for the assassination surrendered or were handed over. During the German occupation of Norway, some 10,000 Norwegian hostages were executed for sabotage or cooperation with the Allies; 7,000 people were similarly killed in Belgium. These figures were far outnumbered in the mass slaughter of hostages in France where up to 100 persons were regularly slain as reprisal for the murder of one German soldier. Mass execution of hostages also took place in Russia and Italy during the occupation.

Hoste, Sir William (1780-1828). British sailor. Born at Ingoldisthorpe, Norfolk, Aug. 26,

1780, he entered the navy at thirteen. He served under Nelson, who "treated him as a son." He was present at Toulon, Cape St. Vincent, and the Nile. In 1805 Nelson moved him to the *Amphion*, but he

was at Algiers when Trafalgar was fought, and was "almost overwhelmed" at having missed the action and lost his friend. In 1808 Hoste took the *Amphion* to the

Adriatic, where he carried on a vigorous campaign against French merchant shipping as well as against war vessels, winning particular glory off Lissa, March 13, 1811, when he decisively defeated the greatly superior French and Venetian frigate squadron under Dubourdieu. In the *Bacchante* he sailed again to the Adriatic, where he resumed his independent activities; in the land attack on Cattaro, on Jan. 5, 1814, he especially distinguished himself. He was made a baronet that year, and died Dec. 6, 1828.

Hostel (Lat. *hospitium*, place of entertainment for strangers). An inn. The use of the word in this sense was revived by Sir Walter Scott, in his romances, but is only literary. It is an old name for small unendowed colleges at Oxford and Cambridge, and has been adopted for various residential institutions for nurses, and students and workers of both sexes, run on semi-philanthropic lines, and not primarily for the profit of the promoters and managers. Hostels are provided in London and the provinces by the Y.M.C.A., Y.W.C.A., and other organizations, where young men or women of good character can obtain board and lodging at reasonable cost. During the Second Great War most religious, social, and youth organizations maintained hostels for British, Dominion, and Allied troops on leave or on transit through towns. Most were operated in conjunction with canteens. Hostels were maintained by the British government in industrial centres for the accommodation of directed labour. See Youth Hostel.

Hot Air Engine. External combustion engine that utilizes the expansive force of heated air. There are two types, the Stirling and the Ericsson (Fig. 1). In the former the heated air is extracted and fresh air supplied for each cycle of the stroke; in the latter the same heated air is used over and over again, being passed through a metallic regenerator.

A regenerator hot air engine, the most efficient, has two vertical cylinders; the power cylinder, in which the air is heated, and the displacer cylinder. In each cylinder is a plunger connected by a coupling rod to a crank at each end of the flywheel shaft. The cranks are set at right angles, so that when one plunger is at the end of its stroke, the other is near the middle of a stroke. Beneath the power cylinder is a fire to heat

the air, and between the power and displacer cylinders is a passage containing the regenerators. The hot air travels along the passage between the two cylinders and as it expands moves the displacer cylinder, converting the movement into work. As the air in the displacer cylinder cools, its volume is reduced and it passes to the power cylinder through the regenerator, where it is reheated and used over again.

Originally called calorific engines, hot air engines were invented early in the 19th century, but on account of their bulk, slow speed, and inefficiency of the external heating apparatus, they have been rapidly displaced by gas, oil, and steam engines.

During the Second Great War Dutch engineers designed an engine with an efficiency some six times greater than that of the old type. By the employment of new steel alloys, the defects of burning and leaking hitherto detracting from the efficiency of hot air engines were overcome, and it was possible to reduce their great bulk. The Dutch engines drove generators for radio sets, and, capable of 3,000 r.p.m., were silent, vibrationless, and almost free from wear. For their particular class of work they proved more efficient than internal combustion engines (see Fig. 2, next page).

Hotbed. Name given to the contents of a garden frame, when the subsoil or bottom layer of the material is composed of animal manure, the decomposition and fermentation of which create artificial heat, useful for forcing and stimulating plant life. Hotbeds may be made at any time of the

Hot Air Engine. Fig. 1: Ericsson Engine. A, beam delivering mechanical power and coupled to working piston B through crank C; D, displacing piston working in cylinder E

year, approximately three months in advance of the time at which the crops they bear are expected to mature. Stable manure, mixed with dead leaves, if the bed is made up in the autumn, should be placed at a depth of about 18 ins. and well moistened with tepid

400 lb. of furnace fuel. Today by far the greater portion of all pig-iron produced in the world is made by the aid of heated blast. See Blast Furnace; Cowper Stove; Iron and Steel; Metallurgy.

Hotchkiss Gun. An automatic gun invented by B. B. Hotchkiss

Hot Air Engine. Fig. 2: Phillips Engine. B, burner; Vw, hot end; Zk, cold end; ZH, cold end; M, heater to heat air in hot end; K, cooler; R, regenerator delivering air to hot and cold ends; S, shaft rotated by lever motion DDDDD riding on pivots at C1 and C2. See text in preceding page

water. After being beaten down firmly, the bed should be covered by the frame, or other glass light available, for a week, to allow the foul steam to accumulate and pass away.

A layer of good, rich loam to the depth of 6 ins. to 1 ft., according to the nature of the crop to be raised, should then be spread upon the manure, and the hotbed is ready. Its average temperature should be maintained at 70° to 75° F., and when it falls below this point, the heat must be raised by the introduction of fresh manure. See Compost.

Hot Blast. Use of mechanical means for the purpose of supplying air more or less under pressure (forced draught or blast) to furnaces for the melting of metal. It appears early in the history of metallurgy, but the air was always used at atmospheric temperature until 1832, in which year a system of hot blast, devised by J. B. Neilson of Glasgow a few years earlier, was put into operation at the famous Gartsherrie ironworks in Lanarkshire. Neilson heated his air by extra fuel; but about the same time Faber du Faur, in France, was beginning to utilise the heat of the waste furnace gases from the furnace itself, for the same purpose. It was found that with Neilson's system 100 lb. of fuel expended in heating the air supplied to the furnace saved

(1826-85), American mechanic. The gun is gas-operated, the breech mechanism being actuated by a portion of the gases generated by explosion of the cartridges passing through a vent in the barrel before the projectile leaves the barrel. The gases force back a piston riding in a cylinder below the barrel, so sending the breech to the rear. The breech block, extractor, firing-pin, and other working parts are returned after the firing of each round by the expansion of a spring compressed by the rearward movement of the piston. The gun is cooled by air flow over the barrel. Rate of fire is 400 rounds per minute, and there are various types of Hotchkiss firing ammunition ranging from 1 lb. shell to .300 rifle ammunition. At one time the Hotchkiss was the standard automatic weapon in most armies, but in the British army it has been superseded by the Bren, Vickers, and Lewis guns. A heavy type of Hotchkiss is still used on small vessels of the Royal Navy. See Cannon; Machine-Gun.

Hotchpot (Fr. *hocher*, to shake, *pot*, pot). Term of English law. It means the bringing of property into a common fund or account so as to entitle the person bringing it in to share in the common fund which has been increased by his addition. It used to apply to lands given by a father to his daughter

on her marriage for herself and the heirs of the marriage. If the father died, leaving the same daughter and other daughters his co-heiresses, the married one could not take any of the inheritance unless she brought into hotchpot the land given to her by frank-marriage.

Under the Administration of Estates Act, 1925, when the property of a deceased person who has died intestate is divided among his children the same principles apply. Any property which the deceased in his lifetime had given to any child by way of advancement or marriage portion must be reckoned as part of that child's share for the purpose of the division.

Thus, a father has five children. In his lifetime he gives to his eldest daughter, A, £20,000 as a marriage portion. To a son, B, he gives £10,000 to buy a business. The father dies, leaving £50,000. A will not ask for anything out of the estate, because she would have to bring in her £20,000 and then share equally, and her share would be $(£50,000 + £20,000 + £10,000) \div 5 = £16,000$. B will come in, bringing his £10,000 into hotchpot. $£50,000 + £10,000 = £60,000$ will thus be divided equally between B and his other three brothers and sisters, yielding £15,000 each.

In wills and settlements the testator or settlor frequently directs that on a general division of the estate certain beneficiaries who have received previous benefits shall bring them into hotchpot. See Inheritance; Will.

Hotel. Modern term for a superior inn or tavern, a house where travellers and others are fed and lodged for payment. The word is a French one, and was at first used for a large house; this use persists to some extent. The palatial modern hotel dates from the introduction of railways, one of the first opened in England being the G.W.R. hotel at Paddington. A still more recent development is the residential hotel, where self-contained suites of rooms can be secured for prolonged periods, meals and service being provided by the hotel management. See Inn.

Hôtel de Ville. French name for a town hall, the German equivalent being Rathaus. Many of these buildings are remarkably fine structures, notably those in Orléans, Saumur, and St. Quentin. That in Paris is a splendid example of modern architecture. The one it replaced dated from the 16th century, and was burned

down during the rising of 1871. Excellent examples occur in Belgium, for example, at Brussels. See Town Hall.

Hôtel Dieu. The name given in France and elsewhere to a hospital, in the older sense of the word. The most noted is the one in Paris. It stands on the island in the Seine, and is said to have been founded in the 7th century. It was rebuilt in 1772, and again on another site in 1868-78. It is now a hospital of the regular type with a medical school attached. There are fine ones at Beaune and Tonnerre, and there is one at Montreal, a modern building but an old foundation. See Hospital.

Hothouse. Any glasshouse in which a minimum temperature of 65° F. is maintained by a coke-burning boiler and 4-in. hot water pipes to provide suitable conditions for the cultivation of tropical plants. Gardeners call a hothouse a stove and refer to the plants grown there as stove plants. Owing to the increased cost of fuel and other difficulties, hothouses are far less numerous than they were. Noteworthy collections of tropical plants in hothouses of large country estates have dwindled or disappeared, and it is now chiefly in botanical gardens that such plants are to be seen. Many species possess richly coloured leaves or brilliant flowers: among them are caladium, pitcher plant or nepenthes, gardenia, anthurium, and stephanotis as well as orchids. Tropical ferns are also grown there. Hothouses are used to force lilac, lily-of-the-valley, and other shrubs and plants into early bloom for the market. To counteract the heat of the glasshouse the atmosphere has to be kept moist by spraying with water.

Hot Springs. Natural outflow of water at a higher temperature than its surroundings. Most hot springs are found in the vicinity of volcanoes or in volcanic regions. They emerge sometimes at the side of glaciers or in the beds of rivers. Hot springs which periodically erupt violently are known as geysers. Many hot springs have waters possessing healing properties. See Geyser; Spa.

Hot Springs. City of Arkansas, U.S.A., the co. seat of Garland co. It is on the Ouachita river, in a valley between Hot Springs Mt. and West Mt., two wooded ridges of the Ouachita Range, and is surrounded by 340 m. of the shore of Lakes Catherine and Hamilton. Situated 54 m. W.S.W. of Little Rock, it is served by rlys. and an

airport. A health resort, it is visited by sufferers from gout and rheumatism for its thermal mineral waters, supplied by 47 springs in the W. slope of Hot Springs Mt. The area containing the springs is the oldest national park in the U.S.A. De Soto visited the springs in 1541, and they were a source of contention among the Indians. To prevent their exploitation for private gain, the government reserved some of the surrounding land in 1832, and in 1921 most of it became a national park. In 1882 the government erected an army and navy general hospital. At the summit of Hot Springs Mt. there is a steel tower commanding a wide view. Hot Springs was settled in 1804, incorporated in 1876, and became a city in 1879. Pop. 21,370.

Hot Springs. A village of Virginia, U.S.A., in Bath Co. Situated amidst the Allegheny Mts. at an alt. of 2,300 ft., 206 m. S.W. of Washington, it is served by the Chesapeake and Ohio rly. Its thermal springs attract sufferers from rheumatism and gout. The first hotel on the site was built in 1765 and used as a hospital during the Civil War. The U.N. conference on food and agriculture, attended by spokesmen of 44 countries, met here in 1943. Pop. 2,963.

Hotspur. Name by which Sir Henry Percy, eldest son of the 1st earl of Northumberland, was known. He was killed at Shrewsbury in 1403. See Percy; Shrewsbury, Battle of.

Hottentot (Dutch, quacker). Primitive people in S. Africa. Calling themselves Khoi-Khoi, they apparently represent an early

intermingling of semi-Hamite negroids with bushwomen, perhaps in Somaliland. From the former came their pastoral nomadism, knowledge of metals, and some grammatical elements; from the latter much primitive culture and some of the bushman "clicks" (*q.v.*). Driven down the W. tablelands by Bantu pressure, at the European discovery they shared with the bushmen who preceded them the W. half of the Cape peninsula.

Now mainly in the N.W., they comprise 56,000 Cape Hottentots and upper Orange river Koranas, besides 14,000 Namaqua in the S.W. Africa protectorate. Weaklimbed, brownish-yellow, long-headed, 5 ft. 3 ins., with pointed chins and matted hair, the women frequently present certain anatomical peculiarities, including steatopygia, and practise finger-joint mutilation. Their dress, besides the fur kaross, includes wallets or loinbands for holding tool equipment. They use wood and calabash milk-bowls and rude clay cooking-pots. Their portable beehive huts, arranged in small groups, betoken a loose social organization. Their magico-religious customs, dominated by witch-doctors, include ceremonial dancing at the new moon. They reverence two ancestral heroes, Tsui-goab and Heitsi-eibib; the mythology is of bushman complexion.

Racial purity has been affected by Boer and Bantu contact. Much of the population ranked as Hottentot, except in Namaqualand, is half-breed, speaking a debased *taal*, and employed as herdsmen or wagon-drivers. The Griqua, formerly in the Kimberley district, and at first called Bastards, are of Dutch-Hottentot descent. Hottentot levies formerly recruited the Cape Mounted Rifles. See Bantu; South Africa.

Hottentot Fig (*Mesembryanthemum edule*). A prostrate succulent shrub of the family Ficoideae, native of S. Africa. It has three-sided fleshy leaves, pointed at each end, and large yellow solitary flowers. The fruit, which is shaped like a small fig, contains a pleasantly acid mucilage which forms the basis of a preserve. See illus. next page.

Hottentot's Bread (*Testudinaria elephantipes*). Climbing herb of the family Dioscoreaceae, native of S. Africa, more usually known as Elephant's-foot (*q.v.*).

Hottentot. Girl and man of this primitive South African people

Hottentot Fig. Foliage, flowers, and fruit of this South African shrub; see article in preceding page

Hottentots Holland. Dist. in Cape Province, S. Africa. As its name implies, it is one of the outposts of Dutch colonisation in S. Africa. The Hottentots Holland Mts. begin at the S. extremity of the Stellenbosch Mts., and run S.W. to the shores of False Bay. The rly. to Caledon goes through Sir Lowry's Pass, a gap in the range where the river Steenbras rises.

Hot Water Supply. There are two methods of providing hot water for domestic purposes

The storage system, the more popular, is equally suitable for large or small installations.

The general aim is to maintain sufficient hot water in storage, at about 150° F., to meet the probable maximum hourly demand. This varies for domestic purposes from 20 to 40 gallons for houses of 3 or 4 bedrooms. Sometimes 120° F. is preferred. In addition to reducing heat loss, and steaming at taps, this minimises furring and lessens the danger of scalding. But as a greater quantity of cooler water is necessary to meet a given duty, this lower storage temperature normally increases both draw-off and storage by 25 per cent.

The general lay-out of a direct domestic hot water supply installation, in which the water is heated by direct contact with the boiler-plate, is shown in Fig 1. The boiler may be an independent unit, as in the diagram, or a back boiler of an open fireplace or cooking-range. The storage cylinder may be of galvanised steel or copper; a rectangular steel tank will leave more shelf room in a cupboard.

Circulation through the primary circuit, between boiler and cylinder, is due to simple action of gravity. This movement arises from a difference in temperature and density

between the two columns, as explained under Heating (*q.v.*). Outflow occurs as indicated in the diagram by arrows when a hot tap is opened, the hot water being displaced from the top of the storage vessel by an inflow of cold water at the bottom from the cold feed pipe.

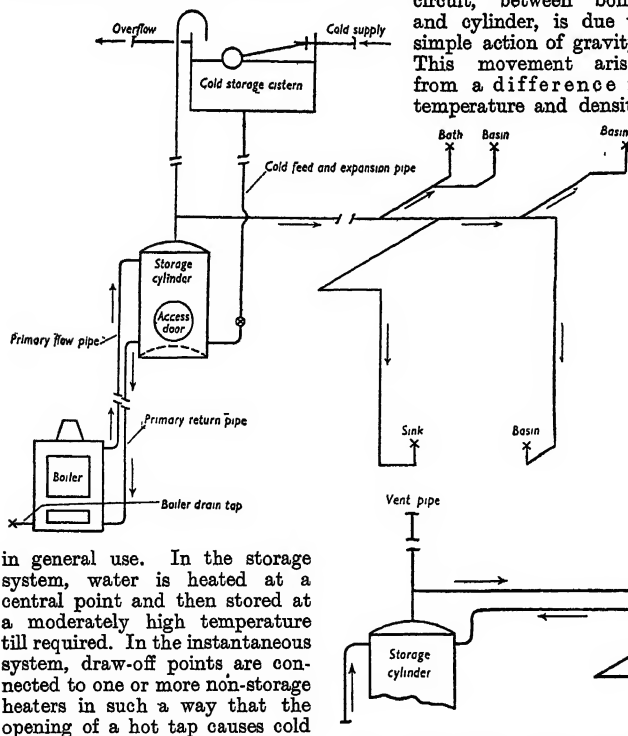

The "dead-leg" distribution shown in Fig. 1 requires that the cool or cold water lying in these pipes must be run to waste before hot water can reach a tap. Water supply by-laws often limit a dead-leg service to about 25 ft. When a longer pipe is required, it is necessary to provide a secondary

Hot Water Supply. Fig. 3. Indirect hot water horizontal cylinder, showing primary flow (B) and return (D); secondary flow (A) and return (E). C, cold water feed
Ideal Boilers & Radiators, Ltd

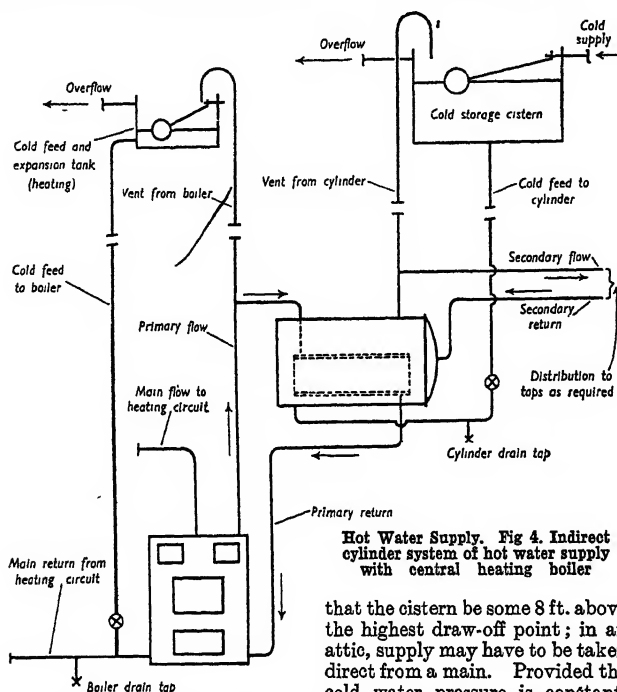

circulation by a loop of pipework as shown in Fig. 2. The circulation indicated by the arrows does not operate during outflow, when water moves along both pipes towards the open tap, but is continuous at other times.

When a domestic supply is heated by a central heating boiler, it is usual to employ an indirect cylinder as seen in Fig. 3, to avoid possible furring of the boiler and prevent rust from the radiators fouling the tap supply. These cylinders may be used horizontally or vertically. Fig. 4 shows the pipework arrangement of the hot-water supply section of such a system. The boiler water then circulates only through the primary circuit, and is not subject to change by draw-off. The water of

Hot Water Supply. Fig. 1 (upper). Direct cylinder system of hot water supply. Fig. 2 (lower). Secondary circulation in distribution of hot water to taps

in general use. In the storage system, water is heated at a central point and then stored at a moderately high temperature till required. In the instantaneous system, draw-off points are connected to one or more non-storage heaters in such a way that the opening of a hot tap causes cold water to flow through a heated coil of pipework, and thus become heated before leaving the fitment.

Hot Water Supply. Fig. 4. Indirect cylinder system of hot water supply with central heating boiler

the hot service is stored within the outer cylinder, and is heated indirectly by contact with the inner. As before, the distribution may be dead-leg, or may require a secondary circuit.

The only valid objections to the storage system are that loss of heat from water-backed tank and pipe surfaces may be excessive, and that continuous firing is necessary. In good practice, heat loss is largely eliminated by suitable lagging. Alternatively, the heat given off by a storage-tank may be usefully employed by housing the vessel in an airing cupboard.

An instantaneous water-heater, whether single- or multi-point, has the merit of heating water only for immediate use and in the exact quantity required. The general arrangement of a multi-point unit is shown in Fig. 5. The distribution is again dead-leg, without possibility of a secondary circulation. The gas supply, ignited by a continuously burning pilot jet, is controlled by the flow of water, and is cut off automatically by interlocking mechanism when the draw-off tap is closed.

The cold supply is best taken from a storage cistern to ensure a constant pressure. A limiting factor is that the water-pressure operated gas valve usually requires

that the cistern be some 8 ft. above the highest draw-off point; in an attic, supply may have to be taken direct from a main. Provided the cold water pressure is constant, the flow may be regulated: the slower the flow, the hotter the tap supply. At best, the discharge from a gas heater of this kind is necessarily less than from a good storage type installation.

Small electric water heaters are normally of the storage pattern, consisting of a heavily insulated cylinder supplied with cold water through a ball valve, and fitted with an immersion heater controlled by a thermostat; these are most commonly single-point units.

Hot Water Supply. Fig. 5. Supply from multi-point instantaneous gas heater

Larger immersion heaters installed in storage cylinders provide hot water at all points.

J. W. Cowan

Houblon, Sir John (d. 1712). London merchant and banker. The son of a London merchant, a descendant of a Huguenot family, and probably a brother of Abraham Houblon, great-grandfather of Viscount Palmerston, he became a member of the Grocers' Company (g.v.). In 1689 he was sheriff and alderman and was knighted. He became lord mayor in 1695, and during 1694-99 was a

Sir John Houblon, London merchant After J. Closterman

lord of the admiralty. He was in 1694 one of the subscribers towards the establishment of the Bank of England (g.v.), and was appointed its first governor. It was at his instigation in 1696 that the bank advanced £200,000 to the king for the expenses of the army in Flanders. He died Jan. 10, 1712, and was buried in the church of S. Benet, Paul's Wharf.

Houbraken, Jacobus (1698-1780). Dutch engraver. Born at Dordrecht, Dec. 25, 1698, he was the son of Arnold Houbraken (1660-1719), a painter who spent several years in England and published biographies of the Dutch artists in 1718. Jacobus was a craftsman of high skill and engraved a large number of portraits, including many of distinguished Englishmen, which were published in London in 1743-52. He died at Amsterdam, Nov. 14, 1780.

Houdan. Domestic breed of fowls with black and white plumage, a peculiar branched comb, and long red wattles. They have short white legs like Dorkings, which they also resemble in having five toes. In France, prolific egg-production has made this a favourite breed with the peasantry; but in England it has been bred too much as a show-bird, with consequent increase of

feathers and reduction of eggs. The birds are hardy, easily reared and managed, and begin laying early. *See* Poultry.

Houdenc, OR HOUDAN, RAOUL DE (12th cent.) A French troubadour. With Chrétien de Troyes he is referred to by the *trouvère* Huon de Méry in 1228 as a master of verse. Houdenc represents the starting-point of two great branches of French literature, the *roman d'aventure* and the allegorical poem. Apart from some shorter pieces, his works consist of the *Roman des Es*, *Méragis de Portlesguez*, and possibly *The Vengeance of Raguidel*.

Houdin, ROBERT (1805-71). French conjurer. Son of a clock-maker, and born at Blois, Dec. 6, 1805, he changed his name from Jean Eugène Robert to Robert Houdin after marriage. He was destined for the law, but his aptness for mechanics induced him to apply himself at first to his father's business until, moving to Paris, he became known as a maker of mechanical toys and automata. On July 3, 1845, he opened a Theatre of Magic at the Palais Royal, afterwards transferring it to the Boulevard des Italiens. His application of the then little-known powers of electricity attracted attention almost all over the world.

In 1852 Houdin handed over his theatre to his brother-in-law, and in 1856 was sent by the French government to Algiers to impress the Arab chiefs with the idea of French superiority over the native marabouts or sorcerers. He gave performances in England in 1848-49 and in Germany in 1852. *See* Conjuring.

Houdini, HARRY (1873-1926). American entertainer. Born at Appleton, Wis., April 6, 1873, he became a locksmith, but went on to the variety stage as an expert in escaping from handcuffs, locked chambers, etc. A keen student of psychic manifestations, he so ingeniously reproduced, by secret methods of his own, the most astonishing forms of so-called phenomena that spiritualist writers hailed him as a medium endowed with powers of dematerialising and rematerialising at will, despite his own explicit assurance that no supernatural agency was associated with his acts. He died Oct. 31, 1926. *His Life Story*, by H. Kellock, appeared in 1928.

Houdon, JEAN ANTOINE (1740-1828). French sculptor. Born at Versailles, March 18, 1740, he

entered the École Royale de Sculpture at 12, won the Prix de Rome at 20, and spent the next ten years in Italy. Returning to France, he won renown as a portrait sculptor and a teacher. His busts included those of Catherine II, Diderot, Turgot, Gluck, and Buffon; his head of Mirabeau is a striking portrait. His bust of Rousseau, now in the Louvre, was made from the death-mask; the Théâtre Français has his bust of Molière and his statue of Voltaire. In 1785 he journeyed to America and made a statue of Washington, a copy of which is outside the National Gallery in London. The only example of his original work in England is the bust of Sophie Arnould as Iphigenia in the Wallace Collection, London. He made busts of Ney and of Napoleon, who rewarded him with the Legion of Honour. Houdon died in Paris, July 16, 1828.

Houghton, RICHARD MONCKTON MILNES, 1ST BARON (1809-85). British poet and politician.

Born in London, June 19, 1809, he was educated at Trinity College, Cambridge, where he became a member of the coterie known as the Apostles, and a friend of Tennyson, Hallam, and Thackeray. He travelled in Germany, Italy, and Greece, 1832-36, and represented Pontefract in the house of commons, 1837-63. He was created Baron Houghton of Great Houghton in 1863, visited Canada and the U.S.A. in 1875, was made F.R.S., and died at Vichy, Aug. 11, 1885.

His works include Memorials of a Tour in Greece, chiefly Poetical, 1834; Memorials of a Residence on the Continent and Historical Poems, and Poems of Many Years, 1838; Palm Leaves, 1844; Life Letters, and Literary Remains of John Keats, 1848; Monographs, Personal and Social, 1873; Collected Poetical Works, 1876.

One of the central figures in the social and literary life of his time, the Vavasour of Beaconsfield's novel, *Tancred*, he was a man of the widest sympathies, the benefactor of David Gray and many another struggling man of letters; one of those who secured the laureateship for Tennyson, and one of the first to recognize the genius of Swinburne. His verse,

notable for its grace and meditative charm, especially in such lines as those of *Strangers Yet and Lady Moon*, has a lasting fragrance. He saw good in most things, a quality his friend Carlyle hit off in the phrase: "There is only one post fit for you, and that is the office of perpetual president of the Heaven and Hell Amalgamation Society." He was succeeded in the title by his son, who in 1911 became the 1st marquess of Crewe (q.v.). *Pron.* Howton.

Houghton, (WILLIAM) STANLEY (1881-1913). British dramatist. He was born in Manchester and educated at its grammar school. Originally in the cotton trade, he developed an interest in the drama, wrote dramatic criticism for *The Manchester Guardian*, and became associated with Miss Horniman in the repertory theatre movement. His own fame as a dramatist rests chiefly on *Hindle Wakes*, 1912, a powerful picture of life in a Lancashire cotton town. First staged in Manchester by Miss Horniman's company, this was later seen in London and was several times revived. It was successfully adapted first as a silent film and later as a talking film. None of Houghton's other plays attained the same success, though *The Younger Generation* remained popular with repertory and amateur companies. He died Dec. 10, 1913.

Houghton-le-Spring. Urban dist. and market town of Durham, England, 6 m. N.E. of Durham. Bernard Gilpin, "the apostle of the north," was rector of the parish, 1556-83. Coalmining is the principal industry. The council owns the water supply in part of the district, also a cemetery, and sewage disposal works. There are two railway stations in the district. Houghton-le-Spring gives its name to a co. constituency including Seaham and the rural district of Sunderland. Market day, Sat. Pop. 29,500.

Houlder Line. British steam- and motor-ship owners. The company was founded in 1864 by Edwin Houlder, a shipbroker and forwarding agent. In partnership with his two brothers, he chartered,

Houlder Line flag; red, with white cross

built, and operated sailing ships for the S. African, Indian, and Australian trade. One of their iron-built clippers, the *Brilliant*, set up a

record on the London-Sydney passage. They eventually transferred their activities to the S. American trade.

In 1890 the company acquired its first two steamships. Nine years later the Houlder Line was formed, later to absorb the Empire Transport company, the British Steam Navigation company, and, in 1946, the Alexander shipping company. The line now owns 20 steamships, the 10,800-ton Hornby Grange being in 1947 the largest ship in the world carrying refrigerator-chilled meat. The Houlder Line maintains regular services between London, Liverpool, and Bristol and S. America; London and S. Africa; Antwerp and the River Plate. Its head offices are at 53, Leadenhall St., London, E.C.3.

Hound. Name given to a dog that hunts by scent. Included in this group are bloodhounds, foxhounds, beagles, and harriers. Such dogs as deerhounds and greyhounds, which pursue their quarry by sight alone, are misnamed. See Bloodhound; Buckhound, etc.

Hound of Heaven, THE. Allegorical poem by Francis Thompson. Its theme is that the individual cannot escape from the power and love of God (the hound). The imaginative sweep, richly decorated lines, and abundance of quotable phrases have given this poem a sure place in devotional literature. Viscount Wavell stated that by reciting it to himself he had found comfort in every dangerous situation, and it is said to have converted persons of dubious faith to Christianity.

Houndsditch. A London city thoroughfare. It runs N.W. from Aldgate High St. to Bishopsgate, parallel with Duke St., Bevis Marks, and Camomile St. Part of what was once known as the City Ditch or Townsditch, formerly surrounding the wall from the Tower to the Fleet, it has the church of S. Botolph at its E. corner. It figures prominently in

Defoe's Journal of the Plague Year. When filled in, paved, and built over in the 16th century it became a sort of Jewry. According to tradition the body of Edric, the murderer of Edmund Ironside, was thrown into the ditch here after he had been beheaded by order of Canute. Much bombed in the Second Great War, Houndsditch contains shops of wholesale merchants and clothiers.

Hound's-tongue (*Cynoglossum officinale*). Biennial herb: family, Boraginaceae. A native of Europe, N. Africa, N. and W. Asia, it has a fleshy, tapering root, and the whole plant is abundantly clothed with soft hairs. The leaves are oblong-lance-shaped; the funnel-shaped flowers are dull red-purple, in short sprays from the axils of the upper leaves. The fruits are four flattened oval nutlets, covered with spines which ensure their distribution by clinging to the fur of animals. See Boraginaceae.

Hounslow. District of Middlesex, England. Within the borough of Heston and Isleworth, it is 12½ m. W.S.W. of London on the railway and District line, and has omnibus connexion with all parts of Greater London. The Great West Road passes for about 3 m. along the N. side of the district. In the coaching age Hounslow was the first posting station on the Great West Road. It is the principal military depot for the county and the headquarters of Eastern Command. Near here are the Royal Military School of Music, formerly Kneller Hall (*q.v.*); Osterley Park (*q.v.*); Syon House, seat of the duke of Northumberland, first opened to the public in 1950; and Cranford church, where Fuller, author of *The Worthies of England*, is buried. The old priory chapel of the Brethren of the Holy Trinity was pulled down in 1828, when the existing church of Holy Trinity was built; the chancel being added in 1856.

Hounslow Heath, which once extended W. from the town for over 5 m., and the greater part of which is enclosed, has been the scene of notable military and other assemblages, and was in the 18th century infested with highwaymen. On it in 1784 was marked the base line, 27,404 ft., of the first trigonometrical survey

made in England. The first airport for London was opened at Hounslow, 1919. Near by is Heathrow, where London airport was established after the Second Great War. Pop. 41,000. See London Airport.

Hour. Twenty-fourth part of a day, divided into 60 mins., each of 60 secs. The length of the hour depends on that of the corresponding day: a sidereal hour is 59 mins. 50.17 secs. of mean solar time, and a mean solar hour is 1 hr. 9.86 secs. of sidereal time (*see* Day). The civil hour is one twenty-fourth of the mean solar day.

Ancient Greeks and Egyptians divided each day and each night into 12 equal parts called temporal hours. These differed in length seasonally as the duration of daylight varied. At the equinoxes day and night are of equal length, so that the temporal hours became equal to one another then. This equinoctial hour is the modern hour, and was first used for all seasons by Hipparchus (*c.* 120 B.C.). It quickly became established in astronomical tables, but the use of temporal hours for the ordinary purposes of life persisted until the 14th century, when mechanical clocks were invented. Since it was impracticable to make clocks strike the unequal temporal hours, they struck equinoctial hours, described as "of the clock" to distinguish them from temporal hours. The phrase survives as "o'clock."

In the Hellenistic period the temporal hours were numbered in two twelve-hour periods starting from sunrise and from sunset. The 24 equal hours of Hipparchus were referred to a zero hour at midnight. Ptolemy in his astronomical tables used 24 equal hours but reckoned from a zero hour at noon. This latter system survived until 1925, since when by international agreement the principal almanacs have used a 24-hour reckoning from midnight. This is the civil day, but for convenience an unofficial division into two 12-hour periods *ante* and *post meridiem* is retained. Attempts to introduce the 24-hour clock into civil use in Great Britain have hitherto failed, except where (as in trans-Continental rail and air travel) confusion might arise between the a.m. and p.m. hours.

Hour Angle. Angle at the celestial pole between the meridian and the hour circle of a star, measured W. from the meridian. Since it indicates the time elapsed since the meridian passage of the star, it is usually measured in

Hounslow, Middlesex. The High Street in this district of Greater London which flanks the Great West Road

hours, mins., and secs. of time rather than in degrees, mins., and secs. of arc.

Hour Circle. Great circle passing through a star and the celestial poles, corresponding in the sky to a meridian of longitude on the earth. Also the movable circle graduated in hours, at the base of the polar axis of an equatorial telescope; or the small brass circle, similarly graduated, at the N. pole of a model celestial globe.

Hour Glass. Instrument for measuring approximately intervals of time, more particularly an hour. It consists of a pair of glass bulbs united by a narrow tube; one of

Hour Glass. Set of glasses in Greenwich parish church

the bulbs contains dry sand, water, or mercury, which in passing through the tube into the other bulb will occupy approximately the time to be measured.

Houri. Promised female companion for faithful Mahomedans when they reach Paradise. According to Sale, translator of The Koran, 72 houris, besides the wives he may have had in this world, await even the meanest of the faithful. See Koran.

Housatonic. A river of the U.S.A. Rising in the Hoosac Mts. in Massachusetts, it flows N.W. for some distance and then S. through Connecticut to Long Island Sound, a few miles E. of Bridgeport. It is about 150 m. long and provides water power for many industries. The tide is perceptible as far as Derby, some 15 m. from the sound.

House. Teutonic word meaning originally covering. Variants are found in Scandinavian, German, and other languages. In addition to its use for a dwelling, the word is used in English for a family, e.g. house of Hapsburg. It is also used for a legislative assembly, as in the houses of lords and commons, and for a business firm. A house journal is one issued for the members and employees of a firm. Among other uses is the phrase House of God for a church. At Oxford, Christ Church is known as the House. So is the London Stock Exchange, among its members. See Commons, House of; Lords, House of.

HOUSE AND HOUSING

A. B. Waters, M.B.E., G.M., F.R.I.B.A.

An account of the development of the house as it exists in Great Britain today is followed by a summary of the legislation governing house building and its financing by the state. See also Architecture; Building; Flat; Prefabrication; Public Health; Slum; Town Planning, etc.

The word house defines a building for human habitation, normally a building that is the dwelling place of a family. The development of the house followed similar lines in all countries of W. Europe. Apart from some few remains, in Great Britain and elsewhere, the earliest forms of dwellings for ordinary people have been lost because they were constructed mainly of short lived materials. From evidence remaining, the earliest houses were round, but soon gave place to houses of rectangular shape.

In the 12th century the feudal system led to the growth of villages in which the serfs lived in huts surrounding the castle of the lord. In times of danger all the inhabitants of the village would retire to the castle, which, because it must at need withstand siege, was strongly built of stone, so that many examples of castles are still to be seen.

Fortified Manor House

As W. Europe became more settled, the castle was succeeded in the 13th century by the fortified manor house, a type which persisted into the 14th century. The main part of the house was the great hall, in which the household lived and, with few exceptions, slept. For the use of the lord there was a room leading off the dais in the hall, with a "solar" or sleeping chamber above, this being the only two-storey portion. The great hall was usually open to the roof. Across the end of the hall remote from the dais was a screen, with openings leading to kitchen and buttery beyond. This simple plan form was the basis of the house of today. Later fortified manor houses had more rooms and were usually two storeys in height. As the number of rooms increased, wings were built to give an E or H shape to the plan, and if this were not sufficient, rooms were built round internal courtyards. Side by side with the manor house, the town house developed. In many districts this was built of timber, and fire has left few surviving examples. Most early houses remaining are in stone districts.

By the 16th century, methods of construction for ordinary houses were well established, and it is

easy to find examples, many of them fundamentally unaltered. The builder used the materials nearest to hand: stone, timber, brick, or brick and timber for the walls, with thatch, tiles, or slates to cover the roofs. There was little variety in plan, and variety in appearance depended upon the method of wall construction and the nature of the roof covering, which determined the pitch of the roof. Greatest variations occur between masonry construction and timber construction. In the first the walls are solid and load-bearing; in the second, the building is a framed structure, the spaces within the frame being merely filled with panels to exclude the weather.

The smaller house developed in succeeding centuries chiefly by changes in plan to render it more comfortable, and to give greater privacy, though there were also changes in external appearance, following architectural fashion. From the 16th century onwards, the classic tradition of Italy began to influence building in England. Hitherto the main influence on building had been exercised by the church; now the great landowners became the more prolific builders. At first this influence was shown by the appearance of classic detail as ornament applied to a building fundamentally Gothic in character.

Renaissance Style

This symmetrical Renaissance style required an architect, who at this time first appeared as the designer of buildings. Previously the master mason had exercised the dual function of designer and builder. Now the building ceased to evolve out of building craftsmanship, and was designed according to set rules.

By mid-17th century the Renaissance style in house architecture was firmly established. The main features were a symmetrical plan, a symmetrical arrangement of the façade, with window openings (following the introduction of the sash window) having the main dimension vertical, slate-covered hipped roofs of low pitch, made necessary now that buildings were more than one room thick and could not have been roofed with the steep pitch necessary with tiles. The whole appearance was

rather plain, relying for its effect on good disposition of well proportioned openings, with points of interest in main doorways, porticoes, etc.

In the 18th century, as the ordinary builder came to understand Renaissance detail and treatment, he began to introduce them into the smaller houses, at first in the treatment of door and window openings, and later in complete façades, with details taken from text-books with such titles as *The Builder's Golden Rule*, and *The British Palladio*,

from which even the village carpenter learnt rules of proportion and correct classic detail. The local tradition imposed by the material at hand still persisted. In the 18th century, too, attention was paid not only to the design of individual buildings, but to the orderly and planned developments of large sections of towns. Houses were grouped together in terraces, and arranged around open spaces laid out with grass and trees.

The final expression of classic architecture in England was reached in the Regency period,

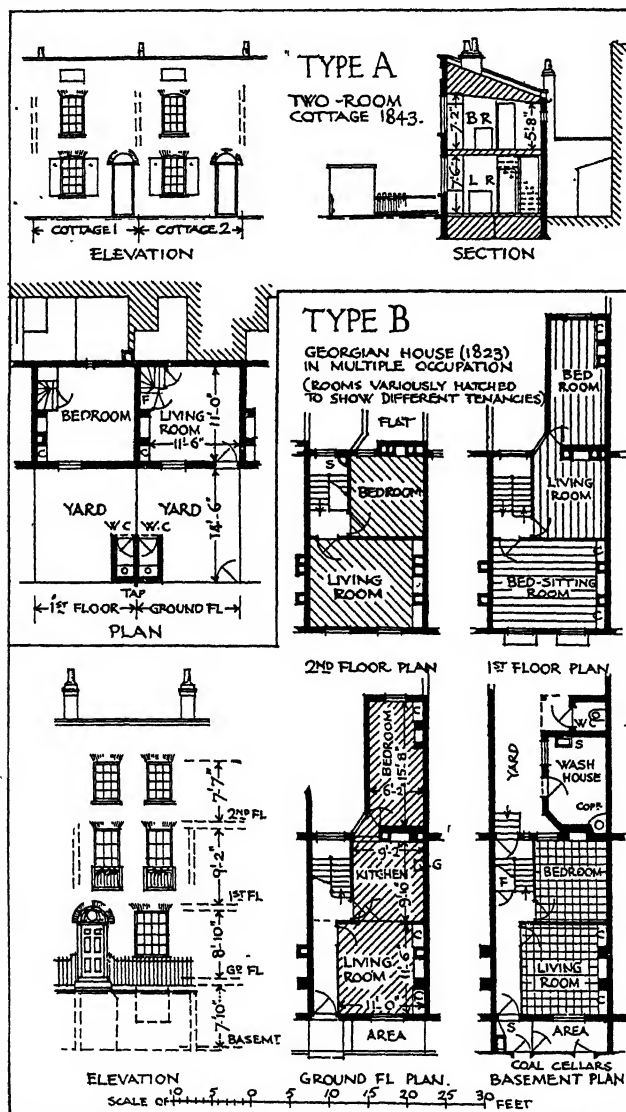

the typical house of that date being finished in painted stucco, with sash windows, porticoes reflecting Greek rather than Roman influence in their detail, and low pitched roofs with widely projecting eaves.

The latter part of the 19th century offers little of interest in domestic architecture. Beginning in the north, and spreading southwards, the industrial revolution was reflected not only in the mean houses huddled round the walls of the factories, but also in the houses of the middle classes, which were badly planned and full of ornament. The simple and gracious style of the Regency period was replaced by dull, pretentious, early Victorian terraces, narrow fronted (to reduce site costs) and tall (to house the large Victorian family), with the dark basements and badly-lighted attics then considered suitable for the domestic staff. Machine-made materials in an age of cheap transport broke the local traditions imposed by the use of materials near at hand. While terrace houses persisted in towns, with French Gothic as the source of inspiration, there was a preference for individual detached houses, and the conception of the street as a unit of design was lost.

Twentieth Century Revival

The reaction to this degenerate use of imported styles was an attempt to return to the native tradition of craftsmanship as the basis for design. William Morris voiced his protest, and he was followed by such men as Philip Webb, Norman Shaw, W. R. Lethaby, and C. F. A. Voysey. The country houses built by Shaw were based on the medieval manor house, while his town houses followed the Renaissance tradition. More influence on later British building was probably exercised by Voysey, who gave no thought to previous styles in his work, but relied on simple treatment and good craftsmanship in local materials. Not only was the reaction felt in the design of individual houses, but also in the lay-out of estates. This is to be seen at Bedford Park, London, the first garden suburb, which was laid out by Shaw.

Houses in the English cottage tradition were admirably suited to garden city lay-out and when skilfully handled were pleasing in the result. Unfortunately inferior imitations by suburban speculative builders, who copied features without understanding form, covered much of the country-

House and Housing. Type A: plan of typical small cottage of the Industrial Revolution. Type B: early terrace house; the hatching indicates the several simultaneous tenancies of the house

HOUSE: EXAMPLE OF TWO SEMI-DETACHED HOUSES, 1947
Denman & Son, chartered architects

Front view, showing one of the entrance porches and the pleasant spacing of the metal windows

These houses were built from plans chosen in a national competition organized by the Ministries of Works and Health and the Royal Institute of Architects through the housebuilding industry's standing committee, formed in January, 1945. The interchange of ideas by young architects through this standing committee has resulted in improved designs for the smaller type of house. Special attention has been given to increased living space, the use of labour-saving devices, better means of fuel conservation, good plumbing, and proper protection against noise and damp

Cross-section (right) with 2 ft.-wide concrete foundations, 11 in. brick cavity walls, steel windows in concrete surrounds and roof of plain tiles on battens of felt. Garden elevation (below) shows steel casement doors in concrete surrounds and the neat arrangement of the covered outhouses

HOUSE: AN ARCHITECT-DESIGNED BUNGALOW, 1946

Architect: H. W. W. Fenwick, student, R.I.B.A.

Builders: John Hopkins, Ltd.

This bungalow was built at the cost of £1,080, and was designed to suit a high ground position in Buckinghamshire. It is traditional in construction, having 11 in. cavity walls; facing bricks are local wire-cut and the front elevation wall is finished in "Snowseam" rough rendered. The living-room and bedroom floors are of Swedish redwood blocks.

The living-room is heated by a slow-combustion stove

Front view of the bungalow, showing kitchen, bathroom, and bedroom windows. Openwork brick supports the front porch and the kitchen entrance, and a low brick wall borders the garden

Photos, The Architect and Building News

Layout of bungalow and garden. The latter has an equal area of ground to both front and rear elevations. A tree-lined border on the E. side affords protection against cold winds; the W. side, being open, acts as a sun trap to the rear elevation

This view of the back of the bungalow (with a south aspect) shows three large steel casements and a side door which opens from the living-room on a small loggia to the right

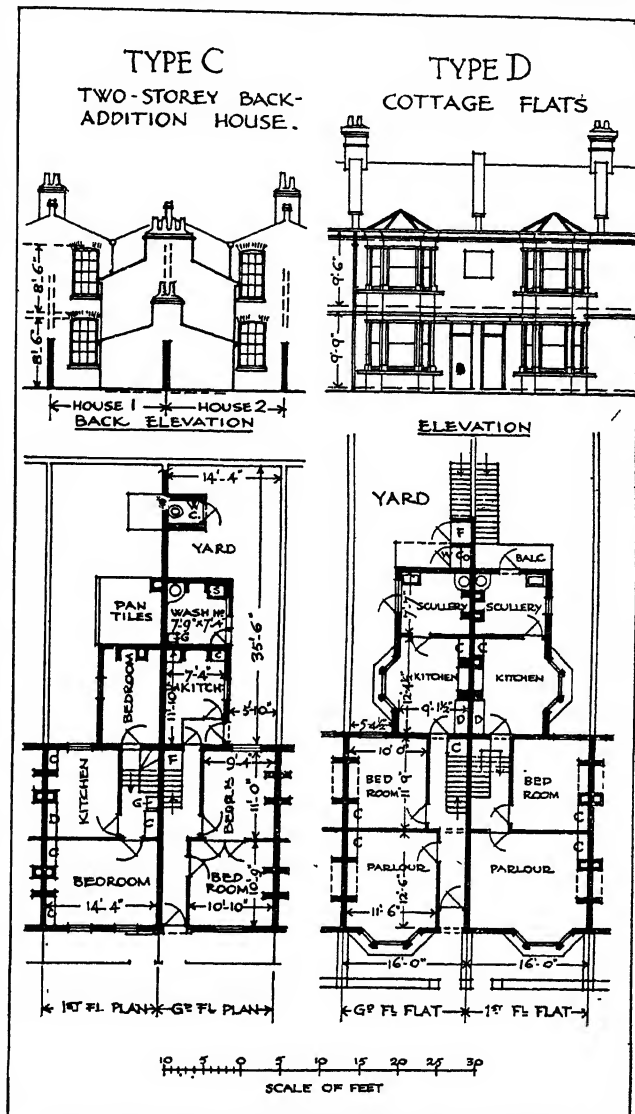

side with dwellings of brick, rough-cast, and sham half-timbering which bore no relation whatever to local tradition. After the First Great War it was local authority housing that produced the best examples of the cottage.

Between the First and Second Great Wars the main influence on the design of houses of all sizes was Georgian, the last of the great styles in England. It satisfied most current requirements, but there was no really consistent thought. At the same time there was a development away from this tradition brought about partly by a change in the method of living, for which large spaces were preferred to individual rooms, and such spaces could be secured by the use of a framed structure having columns and beams of steel or reinforced concrete (instead of the oak of medieval times) with large window openings or panels within the frame. This method of building had developed logically on the Continent from the work of men like Morris, Voysey, and Macintosh, but it proved less successful in England, where some examples of this work, which relies on texture and colour of surface for its principal effect, looked shabby after a few years.

Prefabrication Experiments

During the Second Great War house building virtually ceased in Europe; but in Great Britain much thought was given to preparation for post-war building. A very great number of houses, mostly to rent, were required at once; and the fact that traditional construction involved a long process of erection on the site, followed (since most materials are used wet) by a period of drying out, led to experiment with types of buildings which could be rapidly constructed on the site by fitting together factory-made components. Several novel methods of building were evolved and approved by the authorities; and these "prefabricated" houses, like the houses of traditional type, could be divided into buildings with load-bearing walls and buildings having a framed structure. They had no advantage in cost over traditional construction, though most of them were intended to be temporary. Their fittings for cooking, washing, and other domestic activities were much above the standard to be found in permanent houses of earlier date and comparable size. The application of prefabrication to permanent construction, except

House and Housing. Plans of typical small houses built before 1914
 Drawings from London Survey of Life and Labour, Sir H. Llewellyn Smith (Staples Press)

details such as doors, window frames, and fixtures, remained still in the experimental stage.

HOUSING. The industrial expansion of the early 19th century in the U.K. required a greater concentration of workers than had been known previously, and necessitated the provision of massed houses. Wages were low, and to allow rents to correspond houses were built cheaply. There was no transport, so that people wanted to live as close to their work as possible. There were no building laws governing the con-

struction of streets and houses. The result was that the largest number of persons was crowded into the smallest possible area. Towns grew haphazardly with little consideration for the real needs of the time and none for the future. Houses were mere brick boxes, one room up and one down, without drainage or water supply, and often built back to back, in narrow courts where proper ventilation was impossible.

Reporting to the poor law commissioners in 1838, Dr. Southwood Smith referred to "quarters

inhabited by hundreds of thousands of the labouring classes . . . crowding more or less dense in courts and alleys and narrow streets almost insusceptible of ventilation, in dwellings which themselves were not fit to be inhabited by human beings—while all around the dwellings the utter absence of drainage, the utter omission of scavenging and nuisance prevention, the utter insufficiency of water supply, conduced to such accumulations of animal and vegetable refuse, and to such pondings of odorous liquids, as made one universal atmosphere of filth and stink."

This description might have applied to parts of any sizable town in the middle of the 19th century. Some such groups of buildings remain, and are still inhabited.

The earliest public health legislation was the Public Health Act, 1848, which resulted from public alarm at the heavy incidence of disease in large towns throughout the country. It followed the publication of the reports of the health of towns committee, 1840, and the committee on the sanitary condition of the labouring population, 1842. It had been preceded by the Towns Improvements Clauses Act, 1847, which, however, imposed no control on the building of new houses. During 1865-

1914 many acts, resulting in real improvements, were introduced. The Public Health Act, 1875, some of the clauses of which are still in force, repealed the Act of 1848, and empowered local authorities to make by-laws for the control of the building of individual houses. These building by-laws insisted on good construction of the houses themselves, and the provision of sufficient space around the houses to ensure light and air. (See Public Health.)

Under this legislation, housing of a reasonable standard was provided, before the First Great War, mainly by private enterprise, much by charitable trusts such as the Peabody trust and similar non-profit making bodies, and some by local authorities.

Between 1920 and 1939, the government adopted as the standard for working class housing the recommendations of the Tudor Walters report, 1918, that houses should be built not more than 12 to the acre, each with its own garden, in a well planned estate. The house usually built, often referred to as the "inter-war standard house," had a floor area of 750 sq. ft., and is commonly found in blocks of two, four, and six. A typical house contains a living room, a kitchen, three bedrooms, a bathroom, a W.C.

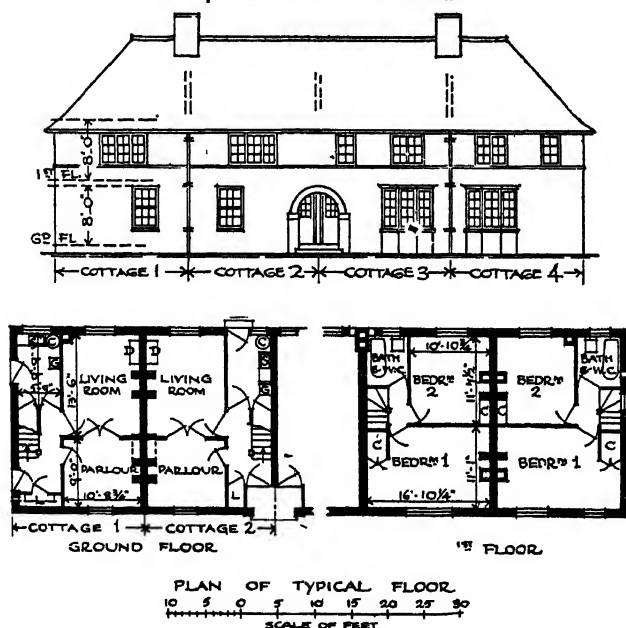

under cover, a ventilated larder, and space for coal, pram, etc.

A better standard of housing meant increased building costs, and therefore higher rents, made all the higher by the rise in building materials and labour from 1920. Building of houses by private enterprise, except for sale, was no longer profitable. To meet this situation the government made local authorities responsible for meeting housing needs in their districts; while the Housing, Town Planning, etc. Act, 1919, restricted to schemes approved before July, 1921, provided that any annual loss in excess of a rate of a penny in the pound should be borne by the state, thus establishing the principle of state subsidisation of housing. Further Housing Acts, 1923 and 1924, provided for a state contribution of a fixed annual sum per house, the remainder of the loss to be borne by the rates.

These grants were modified and subsequently abolished by Acts of 1926, 1928, and 1933. The 1923 Act also provided that the loss on slum clearance and rehousing schemes should be shared between the state and the ratepayer; and an act of 1930 made further and better provision for the clearance and improvement of unhealthy areas, and for dealing with areas (improvement areas) not so bad as to justify total clearance. An Act of 1925 consolidated the permanent law relating to the housing of the working classes in England and Wales, and a further Act of 1935 was concerned with the abatement and prevention of overcrowding. The permanent law relating to the housing of the working classes was further consolidated by the Housing Act of 1936, one of the provisions of which required the minister of Health to set up a central housing advisory committee to consider the operation of, and to advise on matters arising from, the various Housing Acts.

Although the legislation designed to aid the provision of housing by local authorities proved effective, of the total of 4,334,328 houses built between 1920 and 1939, 1,332,189 were built by local authorities with state assistance, 3,002,139 by private enterprise, often by the speculative builder, and including 470,920 built with state assistance. Of working class houses (defined in 1931 as a house with a rateable value of not more than £13 in the provinces), 950,000 were built up

4-ROOM PARLOUR TYPE

House and Housing. Elevation and plan of local authority houses in the period between the two Great Wars

to 1937 by local authorities and 550,000 by private enterprise. (These figures are taken from *Rebuilding Britain: A Twenty-Year Plan* by Sir E. (later Lord) Simon, 1945.)

A sub-committee of the central housing advisory committee was appointed in 1942 "to make recommendations as to the design, planning, lay-out, standards of construction, and equipment of dwellings for the people throughout the country." Their report (*The Design of Dwellings*, usually referred to as the Dudley report) contained recommendations which were widely adopted, both for local authority housing, and also in private enterprise work, although consideration was confined to the types of dwellings commonly built by local authorities, under powers conferred under the Housing Act, 1936.

Dudley Report Recommendations

The report reflected the changes of outlook and habit which had occurred during the 25 years following the publication of the Tudor Walters report. That report assumed that local authorities would build not more than 200,000 houses, although in fact they built more than six times that number. The Dudley committee had in mind the programme of the 1940-45 Coalition government, which envisaged the building of between three and four million houses in 10-12 years, and the creation of independent new towns instead of the extension of existing communities by small estates of municipal houses such as had been thought enough to satisfy the nation's needs in 1918. The Dudley report called attention to the need of dwellings not only for the family of average size, for which the normal 3-bedroom house is suitable, but also for larger families, for old people, and for single people; and to the need for minimum standards of construction somewhat different from the requirements of the by-laws, which are concerned principally with stability. These standards were summarised under the following headings: strength and stability, freedom from damp, thermal insulation, sound insulation, resistance to fire, durability and ease of maintenance, resistance to vermin infestation.

A floor area of 950 sq. ft. for individual dwellings (compared with the 750 sq. ft. of 1918) was proposed; and investigation of the way in which families live resulted in suggestions for different

House and Housing. Part of the Roehampton Estate, London, a typical estate of inter-war local authority housing, as foreshadowed in the Tudor Walters report, 1918.

Ministry of Health, Crown copyright reserved

ways of planning the ground floor as follows:

- | | |
|--|-------------|
| 1. Living Room | 160 sq. ft. |
| Kitchen, with space for meals (Dining-Kitchen) | 110 sq. ft. |
| Utility Room (for laundry, etc.) | 35 sq. ft. |
| 2. Living Room, with recess for meals | 210 sq. ft. |
| Kitchen for cooking and laundry | 100 sq. ft. |
| 3. Kitchen-Living Room | 160 sq. ft. |
| Scullery | 50 sq. ft. |
| Sitting Room | 110 sq. ft. |
| Utility Room in out-building | 35 sq. ft. |

The last is for country districts where cooking must be done on a coal range. Rooms on the first floor are 150 sq. ft., 110 sq. ft., and 70 sq. ft., with a bathroom and separate W.C. Provisions for financing new housing schemes were contained in the Housing (Financial and Miscellaneous Provisions) Act, 1946.

Bibliography. *The English Home* from Charles I to George IV, J. A. Gotch, 1918; *Home Architecture*, R. Newcomb and W. A. Foster, 1932; *Twentieth Century Houses*, R. McGrath, 1934; *The Modern House in England*, F. R. S. Yorke, 1937; *The Architecture of England*, F. Gibberd, 1938; *Rebuilding Britain*, E. D. Simon, 1945; *Housing and the State*, M. E. A. Bowley, 1945; *Prefabrication in Britain*, 1946; many official publications, including *Housing Manual* with Appendices and *Rural Housing*, both 1944.

House, or HOUSEY-HOUSEY. Game of chance popular in the British navy, army, and air force, and the only form of gambling officially permitted in barracks canteens. Basically the game is identical with lotto (*q.v.*), except that occasional variations are made in the methods of covering the numbers to achieve "house."

Thus, at the discretion of the banker, the top, second, or third line only need be completed (single-line house). Alternatively, the top and third lines must be covered, making a sandwich. When calling out his numbers the banker has a recognised patter and various nicknames, *e.g.*, 1 is Kelly's eye; 9, medicine and duty; 11, legs eleven; 21, key of the door; 50, Old West Kents, or blind half hundred; 66, clickety click; 90, top of the house.

House, EDWARD MANDELL (1858-1938). American politician.

Born at Houston, Texas, July 26, 1858, he was educated at New Haven and Cornell university. He exercised influence in the political affairs of Texas, but his wider career was due to his friendship with President Wil-

Edward Mandell House, American Politician

son. In 1914 the president sent House to Europe to gather information about the belligerent countries. With the entrance of the U.S.A. into the First Great War, House was prominent as American representative at various conferences, and then at the peace conference in Paris. He and Wilson never met after 1919. House, who used the title of colonel though never a soldier, died March 28, 1938. *Consult* his *Intimate Papers*, ed. C. Seymour, 1926-28.

Houseboat. Barge with superstructure fitted up as a temporary dwelling; or a permanently moored boat with deck-cabin suitable for residence. In Great Britain house-

Houseboat. Summer and holiday river dwellings of different types, moored on the river Leven

boats are used chiefly on the Thames, the Norfolk Broads, and estuaries of rivers, as summer or holiday houses.

Housebreaking. By the Larceny Act, 1916, the following are made felonies: breaking into and entering a dwelling-house or shop, warehouse, office, etc., and committing a felony (*e.g.* theft) therein, or committing a felony in the building and breaking out of it (maximum punishment 14 years' imprisonment); breaking into and entering any of the above buildings, with intent to commit a felony therein (maximum punishment seven years' imprisonment); entering a dwelling-house in the "night" (*i.e.* between 9 p.m. and 6 a.m.) with intent to commit a felony (maximum punishment seven years' imprisonment).

The main distinction between burglary and housebreaking is that burglary can be committed only at "night" and in a dwelling-house, whereas housebreaking can (as in the two cases first mentioned) be committed in the day time and in a building other than a dwelling-house.

House Flag. Private flag of the owner flown by a seagoing vessel. Every steamship company has its own flag, which is flown in addition to the national flag, the latter being invariably hoisted at the stern. The flags of the principal British and foreign lines are illustrated under their respective companies.

House-fly (*Musca domestica*). Two-winged insect of the order Diptera. Grey in colour with four narrow black stripes down the back of the thorax, it is about $\frac{1}{4}$ in. long. It sucks up its food through a trunk or proboscis ending in a pair of fleshy lobes; this organ is retracted beneath the head when not in use. Many flies that frequent houses belong to other species, including the biting house-fly (*Stomoxys calcitrans*).

The eggs are chiefly laid in heaps of fermenting horse-manure, decaying organic matter, household refuse, etc. Under favourable conditions the eggs hatch in 8-24 hours. The larvae or maggots are $\frac{1}{8}$ in. long when mature and may turn into pupae within a week. Three or more

days are spent as pupae. The flies are most numerous in Great Britain during Aug.-Sept. It is uncertain how they pass the winter—possibly as pupae or larvae.

The house-fly spreads the germs of "summer diarrhoea" among infants; also cholera, typhoid, etc., and maladies caused by parasitic worms. It may act as a mechanical carrier, the germs being attached to the outside of its body; or they may be voided in its excrement on human foods. The destruction of breeding materials and trapping of the flies are the chief measures for keeping them under control.

Household. Collective term for those who reside in a house, including any employed in domestic service. In a special sense it is used for the retinue of a sovereign, and the British royal household has a particular importance historically. See Royal Household.

Household Cavalry.

British combined cavalry unit consisting of Life Guards (*q.v.*) and the Horse Guards (*q.v.*). During the Second Great War both regiments were mechanised and on active service as armoured car units. In

House-fly. This common insect, here greatly magnified, carries disease germs on body and legs, thereby infecting food

peace time, however, they are horsed, and act as mounted escort to the sovereign on state occasions.

Household Gods. Name given by the ancient Romans to certain inferior deities who looked after the home and family, especially to the Lares and Penates. See Lares.

Household Troops. Regiments which have a special association with the sovereign. In France such were the *maison du roi*. In England the kings since Charles II have had regular regiments of guards which, although part of the regular army, perform special services on ceremonial occasions, and serve as guards to the royal residences. The British household troops consist of the Grenadier, Coldstream, Scots, Irish, and Welsh Guards (infantry), and the Life and Horse Guards (cavalry). Each regiment is described under its own title.

Household Words. A two-penny weekly miscellany founded, edited, and partly owned by Charles Dickens, and published by Bradbury and Evans. The issues are dated from March 30, 1850, to May 28, 1859, by which time Dickens had broken with his pub-

Houseleek. The plant as it appears in July

lishers following their refusal to print in Punch a statement about his separation from his wife. He then transferred his interest in the journal and the goodwill of his name to the new but similar journal, All the Year Round, published by Chapman and Hall. A Child's History of England and Hard Times, as well as Mrs. Gaskell's Cranford and North and South, originally appeared as serial stories

in Household Words. The journal was famous for its Christmas numbers. See All the Year Round.

Houseleek (*Sempervivum tectorum*). Perennial succulent herb of the family Crassulaceae, native of Europe and W. Asia. The flat fleshy leaves form a dense rosette, and have a purple edge, the flat tip a sharp spine. The leafy, flowering shoots rise straight to a height of 1 ft. or 2 ft., ending in a spreading cluster of dull, red-purple flowers.

Housemaid's Knee. Inflammation of the bursa, which lies over the lower half of the patella or knee-cap. A bursa is a small sac containing fluid which serves to diminish friction between the bone and the tendon of the muscles attached to the bone. As a result

of frequent kneeling on a hard surface, it becomes swollen and enlarged. A similar condition may follow injury or be associated with chronic gout or rheumatism. Treatment consists in resting the limb, immobilising it by strapping, and applying heat. Removal of the fluid by tapping may be necessary.

House of Commons. Lower legislative chamber of the British parliament. It is elected by popular suffrage and consists of 625 members. *See* Commons, House of; Parliament.

House of Keys. Lower house of the legislature of the Isle of Man. *See* Keys, House of.

House of Laity. One of three houses of the national assembly of the Church of England, the others being the house of bishops and the house of clergy. It consists (1949) of 222 members for the province of Canterbury, 118 for the province of York, and two co-opted, totalling 342. The number is fixed from time to time by the church assembly. They are elected every five years by the lay members of the diocesan conferences, but always proportionately to the number of persons on the parochial rolls of each diocese. The house of laity may have up to ten co-opted members. It possesses its own standing and legislative committees. It may, on occasions, sit and vote separately.

House of Lords. Upper legislative chamber of the British parliament. Membership is partly hereditary (English peers); partly elective (Scottish and Irish peers); and partly by right of office (law lords and bishops). *See* Lords, House of; Parliament.

House of Representatives. Lower house of the legislature of the U.S.A. *See* Congress.

Housman, ALFRED EDWARD (1859-1936). English poet. Born March 26, 1859, and educated at Bromsgrove School and St. John's College, Oxford, he was ten years a higher division clerk in the patent office before being appointed professor of Latin at University College, London, 1892. In 1911 he was made fellow of Trinity, Cambridge, and professor of Latin at that university. His fame as a poet rests on three small volumes of lyrics: *A Shropshire Lad*, 1896; *Last Poems*, 1922; and the posthumously published *More Poems*, 1936. Simple but highly finished in style, they reveal a bitterness against the world and sometimes a morbid preoccupation with violent death. At their best—e.g. In summer-

time on Bredon; *Loveliest of trees*—they are sublime; at their worst they incline to bathos. As a classical scholar Housman edited Juvenal, Manilius, and Lucan. He died April 30, 1936.

Housman, LAURENCE (b. 1865). British poet and dramatist. Born July 18, 1865, younger brother of A. E. Housman, he attracted attention by his illustrations to Meredith's poem *Jump to Glory* Jane, Christina Rossetti's *Goblin Market*, and Shelley's *The Sensitive Plant*. His

Laurence Housman,
British poet
and dramatist

anonymous volume, *An Englishwoman's Love Letters*, had an immense vogue in 1900. Other works, charming, fanciful, and free from his brother's pessimism, include *A Farm in Fairyland*, 1894; *Bethlehem*, 1902; *Prunella* (with H. Granville-Barker), 1906; *Pains and Penalties*, 1911; *Angels and Ministers*, 1921; *Little Plays of St. Francis*, 1922. Housman published an autobiography, *The Unexpected Years*, 1936; a memoir of his brother, 1937; *Collected Poems*, 1938.

A series of scenes from the life of Queen Victoria, collected as *Victoria and Albert*, 1933, was followed by *Victoria Regina*, 1934; *Palace Scenes*, 1937; and *Gracious Majesty*, 1941. For some time banned from public performance, *Victoria Regina* was finally produced at the Lyric Theatre in 1937, with Pamela Stanley in the name part, and was received with enthusiasm, though it was no more than a selection of intimate and imaginative episodes from the queen's private life.

Houssay, BERNARDO (b. 1887). Argentine physiologist. Professor of physiology in the medical school of the University of Buenos Aires, and a scientist of international repute, he conducted researches into endocrine glands and their secretions. He shared the 1947 Nobel prize for medicine.

Houssaye, ARSÈNE (1815-96). French writer. Born at Bruyères, Aisne, on March 28, 1815, the family name being Housset, he published his first novel, *La Couronne de Bluets*, in 1836. He was a writer of great versatility, a friend of many notable writers and artists of his day, and during 1849-59 was director of the Thé-

âtre Français. He died in Paris, Feb. 26, 1896. Among his writings may be mentioned studies of Flemish and Dutch art, 1846, and of Leonardo da Vinci, 1869; his life of Mme. du Barry, 1873; a satirical story, *L'Histoire du 41me Fauteuil de l'Académie Française*, 1855; comedies, including *La Comédie à la Fenêtre*, 1859; and novels, mostly of Parisian life.

Houston. The largest city of Texas, U.S.A., and the co. seat of Harris co. It stands on the Houston ship channel, at the confluence of the Buffalo and White Oak Bayous, 50 m. N.W. of Galveston, and is served by rlys., airport, and steamship lines. The newest of the U.S. major shipping centres, Houston has become the world's biggest oil port and the nation's biggest cotton market. Improvement of port facilities, on which £11,250,000 had been spent by 1940, began with the construction in 1914 of the ship channel, 35 ft. deep at its shallowest and 200 ft. wide at its narrowest point. The banks of the channel are lined with oil refineries, chemical plants, steel, cement, and rubber factories, and sugar mills. Nearly all the world's sulphur is obtained within 50 m. of Houston. Within 100 m. are 268 oil fields. Among the products shipped are maize, livestock, rice, lumber, salt, and figs.

The climate is semi-tropical. Notable landmarks are the 37-storey Gulf Building, the federal district court, county courthouse, city hall, museum of fine arts, Sam Houston Coliseum (which seats 20,000), Miller memorial theatre, and Jefferson Davis hospital. Rice Institute, providing higher education free of tuition fees, and the university of Houston are also here. There are 3,000 acres of parks. Houston, founded 1836 and incorporated 1840, was formerly capital of Texas. The city was named after Sam Houston (*q.v.*). Pop. 384,514.

Houston, LADY (d. 1936). British patriot. Fanny Lucy, daughter of Thomas Radmall, was born in London. Her second marriage was in 1901, to the 9th Lord Byron (d. 1917). In 1917 she was created one of the first dame commanders of the British Empire for her work in women's welfare. In 1924 she married Sir Robert Houston (d. 1926), a shipping magnate who left a fortune of £8,000,000. Lady Houston gave financial assistance to many patriotic causes: a gift of £100,000 went towards the cost of defending the Schneider Trophy in 1931, and

in 1933 she financed the Mt. Everest air expedition. She died Dec. 29, 1936. A biography by W. Allen appeared in 1947.

Houston, SAM (1793-1863). An American soldier and politician. Born near Lexington, Va., March 2, 1793, of Scottish-Irish descent, he moved to Tennessee and lived among the Cherokee Indians, of whose cause he was a lifelong supporter. When, in 1835, Texas declared itself independent of Mexico and hostilities broke out on the attempted disarmament of the American colonists, Houston was appointed commander of the Texan army. His decisive victory over the Mexicans on the San Jacinto river and the capture of their president, Santa Anna, April 21, 1836, secured the independence of Texas.

Houston sat in congress as senator for the new state when it joined the U.S.A. in 1845. During 1859-61 he was governor. Having refused to swear allegiance to the confederate states or to support the secession movement, he was deposed and retired into private life. He died at Huntsville, Texas, July 25, 1863. The largest city of Texas is named after him. *Consult* The Raven, M. James, 1931.

Houston Line. British steamship company. Founded in 1880 by Robert Houston, the firm is officially R. P. Houston & Co. It was acquired by the Clan Line in 1918. It runs a cargo service from U.K. and U.S.A. ports to S. America

Houston Steamship Line flag, Union Jack and red cross on white

and S. Africa. The company was one of the pioneers in the River Plate trade. The head office is at 4, St. Mary Axe, London, E.C.4. *See* Houston, Lady.

Houyhnhnms. In the last part of Swift's *Gulliver's Travels*, a race of horses endowed with reason. They are represented as gentle and gracious, and as ruling over the Yahoos, beings human in shape but brutal in nature. The name, pronounced whin'ims, is probably meant to suggest the neighing of a horse. *See* Swift, Jonathan.

Hova. Name popularly denoting the dominant Indonesian population of the Imerina highlands, central Madagascar. Short, olive-yellow, straight-haired, flat-faced, round-headed, these people are descended from Malayan immigrants who probably arrived in the 15th

century. Mingled with the primitive Vazimba, they overturned the negroid Sakalava power, becoming supreme during the 19th century. They comprised three classes: nobles, hova or freemen, and slaves. The abolition by France of local kingship and slavery extended the name hova from the middle class to the whole. *See* Madagascar; Malagasy.

Hove. Borough and seaside resort of Sussex, England. It is

sunshine, many having the habit of hovering in the air on rapidly vibrating wings. The larvae of species of *Syrphus* and its allies destroy plant lice and are therefore beneficial.

Hovey, RICHARD (1864-1900). American poet. Born at Normal, Illinois, May 4, 1864, he first studied for the Church, and then turned successfully to journalism, the stage, and lecturing. In 1893, with Bliss Carman (*q.v.*), he pub-

Hove, Sussex. The sea front, promenade, and lawns looking east; in the distance is seen Brighton's West Pier

51 m. by electric rly. S. of London, and is bounded E. by the co. bor. of Brighton and W. by the urban dist. of Portslade. The attractions include the King Alfred baths erected by the corporation and opened 1946, with two sea water swimming baths, restaurant, sun terraces, miniature rifle range, car park, and indoor bowling greens. There are sea promenades and parks, a county cricket ground, and the Brighton and Hove Albion football ground. Hove received its charter in 1898, and became a bor. constituency in 1948. Pop. est. 67,940.

Hove arms

Hoveden, ROGER OF (d. 1201). English chronicler. Born at Howden or Hoveden, E. Yorks, he became an official at the court of Henry II. Much of his life was passed in the king's service, but he is known only by his *Chronicle*, a general history of England from 732 to his death in 1201. The last part only is valuable. Until 1169 Roger merely copies other writers; from 1170 to 1192 he follows Benedict of Peterborough, although making additions; but from 1192 the book is original and carefully written. There is an edition in the *Rolls series*.

Hover-fly (*Syrphidae*). Large family of flies that are active in

lished *Songs from Vagabondia*. A second and third series appeared 1896 and 1900. His separate works were a volume of miscellaneous poems, *Along the Trail*, 1898; a dramatic trilogy, *Launcelot and Guenevere* (*The Quest of Merlin*; *The Marriage of Guenevere*; *The Birth of Galahad*), 1890-98; *Taliesin, a Masque*, 1900; and a posthumous volume, *To the End of the Trail*, 1908. He died Feb. 24, 1900.

How, WILLIAM WALSHAM (1823-97). British divine. Born at Shewsbury, Dec. 13, 1823, he was the son of a solicitor. Educated at Shrewsbury School and Wadham College, Oxford, he was ordained in 1846. Rector of Whittington, Salop, in 1879, he was chosen suffragan bishop under the bishop of London; he took the style of bishop of Bedford, but his district was the east end of London. There he did a great work, founding the East London Church Fund and initiating philanthropic activities. In 1888 he was made bishop of Wakefield, where he remained until his death, Aug. 10, 1897. How wrote several beautiful hymns, *e.g.* For all the Saints, and was of saintly life.

W. W. How, British divine

Howard. Famous English family, now represented by the duke of Norfolk, the earl of Carlisle, the earl of Effingham, the earl of Suffolk and Berkshire, Lord Howard of Glossop, Lord Howard of Penrith, and others. The descent is traced authentically to William Howard, or Haward, a lawyer in Norfolk in the 13th century. He was probably descended from a family that had lands at Wiggenghall, near Lynn. He became a justice of the common pleas and a rich man, owning land in his native county. His son John became a knight, a soldier, and the owner of further Norfolk lands.

The great event in the rise of the Howards, however, was when Sir Robert, early in the 15th century, married Margaret, daughter of Thomas Mowbray, duke of Norfolk. Their son John fought for the Yorkists during the Wars of the Roses, and in 1470 was made a baron. He became one of the heirs to the estates of the Mowbrays, and, having received the bulk of them, was in 1483 created duke of Norfolk and earl marshal. From his son, the 2nd duke, the English leader at Flodden, are descended most of the existing lines. The 4th duke married the heiress of the earl of Arundel. One descendant married the heiress of the Dacres, and from that union sprang the earl of Carlisle and other branches of the Howards settled in Yorkshire and Cumberland. See Arundel, Earl of; Carlisle, Earl of; Effingham, Earl of; Mowbray, Norfolk, Duke of; Nottingham, Earl of; Stafford, Earl of; Suffolk, Earl of; Surrey, Earl of.

Howard, CATHERINE. The fifth queen of Henry VIII of England, is entered as Catherine Howard (*q.v.*).

Howard, JOHN (1726-90). British philanthropist and reformer. Born in Hackney, Sept. 2, 1726, he had an indifferent education at Hertford, and at 16 inherited a small property at Cardington, Beds, and a patrimony which rendered him independent. Having

John Howard,
British philanthropist

travelled much abroad, in 1773 he was chosen high sheriff of the county and had to visit Bedford prison. From this date his life work began. He found that not only were prisons unspeakable, but the

gaolers received no pay and had to wring fees out of the prisoners. He secured payment for gaolers by Act of Parliament, and travelled all over the British Isles visiting county and town gaols and bridewells to expose other evils. In 1775-76 he extended his survey to France, the Netherlands, Germany and Switzerland. Then he published his *State of the Prisons in England and Wales*, to which appendices were added in 1780 and 1784 after further evidence was collected abroad. One result was the introduction of penitentiary houses. Fearlessly exposing himself to hardship, Howard travelled in a plague-ridden ship and went into military hospitals, his Account of the Principal Lazarettos in Europe appearing posthumously in 1798. While studying camp fever near Kherson, Russia, he caught the disease, and died Jan. 20, 1790.

The Howard League for Penal Reform, named after him, was founded in Dublin in 1834. First called the Howard Society, and later, under Lord Brougham's presidency, the Howard Association, it was amalgamated in 1927 with the Penal Reform League (founded 1907) under its present title. It seeks to extend psychological treatment for offenders, and to abolish the death penalty. From its offices at Parliament Mansions, Victoria St., London, S.W.1, it publishes the *Howard Journal* and the *Penal Reformer*.

There are memoirs and lives of Howard by T. Taylor, 1836; J. Field, 1850; E. C. S. Gibson, 1901; J. G. Rowe, 1927.

Howard, LESLIE (1893-1943). British film actor. Leslie Stainer was born in London, April 3, 1893,

educated at Dulwich, and became a bank clerk. Joining a theatrical touring company after being invalidated out of the army, he first appeared in London in 1918, and in 1922 visited New York. In films from 1930 he gained a great following as an actor of quiet sincerity and beautiful diction. His notable pictures, American and British, included *Outward Bound*; *Berkeley Square*; *The Scarlet Pimpernel*; *The Petrified Forest*; *Romeo and Juliet*; *Pygmalion*; *Escape to Happiness*;

Leslie Howard,
British film actor

Gone With the Wind; *Pimpernel Smith*; *The First of the Few*. This last he directed, likewise *The Gentle Sex*, in which he spoke a commentary. Returning from a lecture tour in Spain on behalf of the British Council, he died when the aircraft was destroyed by enemy action, June 1, 1943.

Howard, LUKE (1772-1864). British meteorologist. Born in London, Nov. 28, 1772, he became a chemist, but his fame rests on his classification of clouds. In his essay *On the Modification of Clouds*, 1802, later incorporated in his great work *The Climate of London*, 2nd ed. 1833, he coined the terms cirrus, cumulus, stratus, and nimbus, which are still in use. Howard was elected F.R.S. in 1821. A Quaker, he devoted much of his leisure to religious and philanthropic work, and published a treatise against swearing in 1811. A lifelong friend of John Dalton, also a weather expert, he engaged in a correspondence with Goethe in 1822. He lived until March 21, 1864.

Howard, SYDNEY (1885-1946). An English comedian. Born at Yeadon, near Leeds, Aug. 7, 1885, he joined a concert party, and came to London in the revue *Box o' Tricks at the Hippodrome*, 1919. Real success came in *Hit the Deck*, 1927, and in 1928 he played unforgettably in partnership with Leslie Henson in *Funny Face*. To a ponderous figure and glazed eyes he added a delicacy of movement—especially of the hands—that was irresistibly comic. Other stage appearances were in *It's a Boy*, 1930; *It's a Girl*, 1931; *Night of the Garter*, 1932; *Ladies' Night*, 1933; *Anything Goes*, 1935. Films in which Howard played included *Up for the Cup*; *Up for the Derby*; *Tilly of Bloomsbury*; *The Mayor's Nest*. He died June 12, 1946.

Howard de Walden, BARON. English title borne with intervals since 1597 by the families of Howard and Ellis. In 1597 Lord Thomas Howard, a son of the 4th duke of Norfolk, was made a peer; his mother was the daughter and heiress of Lord Audley of Walden. Howard became earl of Suffolk in 1603, and when the 3rd earl died without sons in 1688 the barony went into abeyance and so remained until 1784. In that year it was allowed to Sir J. G. Whitwell, a soldier who was made Baron Braybrooke; he was descended from a daughter of the 1st Lord Howard de Walden. He died in 1797 and the barony

was next held by the 4th earl of Bristol, a descendant of the 1st lord.

Bristol's great-grandson, Charles Augustus Ellis (1799-1868), succeeded as 6th lord in 1803. He was the son of the earl's granddaughter by her marriage with Charles Rose Ellis, created Baron Seaford in 1826. In 1845 he added the barony of Seaford to that of Howard de Walden, and his descendants have since held both. This 6th lord was British minister at Stockholm, Lisbon, and Brussels. His wife was a sister of the eccentric 5th duke of Portland, and on his death she inherited much London property.

Thomas Evelyn Ellis (1880-1946) succeeded as 8th baron in 1899, and in 1917 assumed the surname of Scott-Ellis. Born to great wealth, he owned property in N.W. London, part of which, in Cavendish Sq., he let to a department store on a 999 years lease after a remarkable lawsuit. A catholic patron of the arts, he wrote plays under the name of T. E. Ellis, also libretti for Holbrooke's operas. Dying Nov. 5, 1946, he was succeeded by his son John as 9th baron.

Howard of Effingham, WILLIAM HOWARD, 1ST BARON (c.1510-73). English diplomatist. Eldest son of Thomas Howard, 2nd duke of Norfolk, and educated at Trinity Hall, Cambridge, he was ambassador to Scotland and France, 1531-41. He was

1st Baron Howard of Effingham

condemned to perpetual imprisonment on a charge of concealing the misconduct of his niece, Catherine Howard (*q.v.*), but pardoned in 1541. Governor of Calais, 1552-53; privy councillor, 1553; lord high admiral, 1554-73, he was raised to the peerage for crushing Wyatt's rebellion, and made a K.G., 1554. He protected Princess Elizabeth against Gardiner, and became her lord chamberlain, 1558. He was appointed lord privy seal, 1572. He died Jan. 12, 1573. His son Charles, the leader against the Spanish Armada, was made earl of Nottingham (*q.v.*).

Howdah. Seat placed on the back of an elephant. It may hold two or more persons, and is sometimes covered.

Howden. Parish and market town of the East Riding of Yorkshire, England. It lies 21 m. W.

of Hull on the railway. The church of S. Outhbert dates from the 13th century, the manor house incorporates remains of the palace of the bishops of Durham, and there is a cross in the market place. Roger of Hoveden, the chronicler, was a native; and Thomas Ward, the jockey who became prime minister to the duke of Parma, was a local character. Market day, Sat. Pop. 2,470.

Howe, RICHARD HOWE, EARL (1726-99). British sailor. The second son of the 2nd Viscount

Earl Howe, British sailor After Gainsborough

Howe (Irish peerage), he was born in London, March 8, 1726. Entering the navy at 13, he made a voyage to Rio de Janeiro and then was sent to the W. Indies, where he saw the action of La Guayra in 1743. In 1755, in command of the *Dunkirk*, he sailed for N. America with Boscawen, and defeated a French fleet off the St. Lawrence. In 1758 he succeeded his brother as 4th viscount, though from 1757 to 1782 he sat in the house of commons as member for Dartmouth.

In 1759 Howe played a prominent part in Hawke's brilliant action in Quiberon Bay. He was appointed treasurer of the navy in 1765, promoted rear-admiral in 1770, and vice-admiral in 1775. Commander-in-chief in N. America, he took part in the reduction of Long Island and New York, 1776-77, cleared the passage of the Delaware, and defeated D'Esterade off Rhode Island. He was in sympathy with some of the colonists'

Howdah on the state elephant of the Maharajah of Mysore

demands and opposed to Lord North's administration, so he spent a few years in retirement near St. Albans, hoisting his flag again in 1782 as admiral commander-in-chief of the Channel. The fleet was ordered to the Mediterranean, and Howe relieved Gibraltar.

In 1783 he was appointed first lord of the admiralty, and in 1788 on his retirement was given an earldom. He was again in 1790 commander-in-chief of the Channel fleet, and whilst occupying this command on June 1, 1794, he engaged the French under Villaret-Joyeuse. Flying his flag on the *Queen Charlotte*, Howe passed through the French line, and in twenty minutes one of the greatest successes of the British navy had been achieved. In 1796 he was promoted admiral of the fleet. He succeeded in settling the Spithead mutiny, 1797. A skilled tactician and a beloved if grim commander, "Black Dick" died Aug. 5, 1799. The best biography is by Sir J. Barrow, 1838. See First of June.

Howe, FRANCIS RICHARD HENRY PENN CURZON, 5TH EARL (b. 1884). British racing motorist. Born May 1, 1884, he went to Eton and Christ Church, Oxford, was commissioned in the R.N.R., and served in the First Great War in the Queen Elizabeth. In 1918 he was elected Unionist M.P. for S. Battersea, and in 1929 succeeded his father in the house of lords. He competed in many important British and Continental races, driving Mercedes, Alfa-Romeo, Bugatti, and Maserati cars. In 1931 he won the Le Mans 24-hour race and in 1934 the gold vase at Brooklands. During the Second Great War he was an instructor in the R.N.V.R.

Howe, ELIAS (1819-67). American inventor. Born at Spencer, Mass., July 9, 1819, he worked for a cotton machinery manufacturer. In 1846, after four years' effort, he took out a patent for a lockstitch machine which is in essentials the foundation of most present-day sewing machines. Coming to England, he sold his English patent rights for £250. He died Oct. 3, 1867. See Sewing Machine.

Howe, JOHN (1630-1705). English Puritan divine. Born at Loughborough, May 17, 1630, he graduated at Cambridge, afterwards holding a fellowship at Oxford. Having taken orders, he was appointed in 1654 to the charge of Great Torrington, Devon, and three years later became domestic chaplain to Oliver Cromwell. He was ejected from Great Torrington in 1662, and spent some cheered

years in England and Ireland before being appointed minister of a Puritan congregation in London in 1675. The persecution of dissenters under James II drove him abroad, but on the publication of the Declaration of Indulgence he returned from Utrecht to be one of the ministers solicited by the king to persuade nonconformists to recognize the dispensing power. Like Baxter and Bunyan, however, Howe proved incorruptible. The author of many religious writings, most of them published after the Revolution, he died April 2, 1705.

Howe, JOSEPH (1804-73). Canadian politician. Born at Halifax, N.S., Dec. 13, 1804, he was the son of a printer who had left the U.S.A. Joseph started a paper in Halifax, became known through his success in a libel action, and in 1836 was returned to the legislature of Nova Scotia. He threw himself heartily into the struggle for responsible government, and when this was granted in 1848 he became a cabinet minister. In 1854 he was made chief commissioner of railways, but did not forsake politics altogether, and during 1860-63 he was premier of Nova Scotia. Howe led the agitation for withdrawal from the federation of 1867, and in 1869 became a minister in the dominion cabinet. He died June 1, 1873, having just been made governor of the province.

Howe, JULIA WARD (1819-1910). American poet and philanthropist. Born in New York, May 27, 1819, she married Samuel Gridley Howe (v.i.). Before the Civil War she edited The Boston Commonwealth, the anti-slavery organ, and wrote the famous Battle Hymn of the Republic. Afterwards she became a noted advocate of votes for women and of prison reform. Her most important works

Julia Ward Howe.

are Sex and Education, 1874; Life of Margaret Fuller, 1883; Representative Women of New England, 1905. She died Oct. 17, 1910.

Howe, SAMUEL GRIDLEY (1801-76). An American philanthropist. Born at Boston, Mass., Nov. 10, 1801, he was educated at Brown university and Harvard medical school. During the Greek war of independence he served as a surgeon with the Greek army, and

helped the cause by collecting funds in America and organizing relief works at Aegina for the refugees. In 1831, at the instance of a committee formed in Boston to establish an asylum for the blind, Howe visited Europe to study the methods used there, and on his return to Boston in 1832 opened a school for blind children in a private house, with so much success that a state grant was made for its future support. In 1839 the institution was moved to South Boston. Turning his attention to idiocy, Howe became chairman of a commission of inquiry, and in 1848 started a school for idiot youths. He died Jan. 9, 1876.

Howells, HERBERT NORMAN (b. 1892). A British composer. Born at Lydney, Oct. 17, 1892, and trained at Gloucester cathedral and at the Royal College of Music. Orchestral pieces by him were played at promenade concerts in 1920 and 1924, and in 1922 his Sine Nomine was performed at Gloucester. His music is unmistakably English without being consciously national; the Tudor influence is recognizable in Lady Audrey's Suite and Lambert's Clavichord. Other works are Puck's Minuet, for small orchestra; Requiem, for soloists and chorus; piano concerto, songs, and chamber music.

Howells, WILLIAM DEAN (1837-1920). American man of letters. He was born at Martin's Ferry, Ohio, March 1, 1837, son of a newspaper proprietor. He worked as a compositor in his father's printing office; was a journalist, with a constant literary intention, 1858-61; U.S. consul at Venice, 1861-65; editor of The Atlantic Monthly, 1866-81; and editor of Harper's Magazine, 1886-91. He was associated also with The New York Times, The Nation, and The Cosmopolitan Magazine. He died in New York, May 11, 1920.

His 70 works include poems, travel books, essays, plays, and criticism. His first book was A Campaign Life of Lincoln, 1860. Venetian Life, 1866, and Italian Journeys, 1867, are delightful transcripts of personal experience. His novels, which reflect analytically the American life of his time, realistically but in proper perspective, include The Lady of the

W. D. Howells,
American Author

Aroostook, 1879; The Undiscovered Country, 1880; A Modern Instance, 1882; The Rise of Silas Lapham, 1885; The Minister's Charge, 1886; The World of Chance, 1893; The Vocation of the Kelwyns, 1920. He was a successful short-story writer, a penetrating critic, and some of his poems reflect the qualities of his prose, which is consistently clear, compact, precise, and felicitous. *Consult* Life and Letters, ed. M. Howells, 1929.

Howitt, MARY (1799-1888). A British author and translator. Born at Coleford, Glos., March 12,

Mary Howitt

1799, daughter of Samuel Botham, a surveyor, and a member of the Society of Friends, she spent her early years at Uttoxeter. There on

April 16, 1821, she married William Howitt (v.i.), with whom she wrote The Desolation of Eyam and Other Poems, 1827. In 1837 began her series of tales for children, popular on both sides of the Atlantic. She translated Frederika Bremer's novels, 1842-63; and many of Hans Andersen's tales, 1845-47. She collaborated with her husband in The Literature and Romance of Northern Europe, 1852. Later she was received into the Church of Rome. She received a civil list pension of £100 in 1879, and died in Rome, Jan. 30, 1888. Her Autobiography was edited by her daughter Margaret, 2 vols., 1889.

Howitt, WILLIAM (1792-1879). British writer. Born at Heanor, Derbyshire, son of a yeoman farmer, who was a member of the Society of Friends, he was educated at the Friends' school at Ackworth and at Tamworth. He married in 1821 Mary Botham, and in 1823, with his wife, made a pedestrian tour of Scotland. For a time he was in business as a chemist and druggist in Nottingham. He travelled in Australia, 1852-54. Among his voluminous writings, the more noteworthy are The Book of the Seasons, 1831, which ran into seven editions;

William Howitt,
British author

Rural Life of England, 1838; Homes and Haunts of the Most Eminent British Poets, 1847; Popular History of England, 1856-62; History of the Supernatural, 1863; The Northern Heights of London, 1869. He died in Rome, March 3, 1879.

Howitzer (Ger. *Haubitzer*, catapult). Short-barrelled gun discharging heavy projectiles at a high angle of elevation and trajectory. Howitzers have been in use since the 16th century, and were first designed as mortars for throwing solid shot over the battle-mented walls of fortifications.

The howitzer is of lighter construction than a long range field gun; one throwing a projectile weighing 45 lb. weighs less with its mounting than does a field gun firing an 18-lb. shell. The length of a howitzer barrel rarely exceeds 12 times its calibre, and the muzzle velocity is usually about 1,000 ft. per second. On account of the high angle of elevation at which a howitzer fires, the projectile strikes the target at a correspondingly steep angle of descent; consequently the weapon can destroy gun emplacements despite heavily protected roofs. The high trajectory of a howitzer shell makes it possible for the gun to fire over obstacles between gun and target. The lower chamber pressure in the gun enables the shells to have thinner walls and base, and thus to contain a greater weight of explosive than the ordinary artillery shell. Excessive recoil is absorbed by hydraulic buffers.

In both Great Wars the Germans, specialising in howitzers, developed remarkably efficient weapons. Howitzers of 17-in. calibre destroyed the Belgian and French frontier forts in 1914. In the Second Great War the belligerent armies used examples ranging from 3.7 ins. to 18 ins. Howitzers up to 6-in. calibre were mounted on tanks and used for the close-range reduction of strongpoints. The U.S. army built a tank-mounted howitzer capable of throwing a 360-lb. shell to a distance of 16 m. The modern trench or field mortar is a howitzer on a small scale. See Ammunition; Artillery; Explosives; Mortar; Ordnance.

Howling Monkey (*Alouata*). Genus of monkeys found in Central and S. America, and especially in the forest regions of Brazil. The hyoid bone at the upper extremity of the windpipe is enormously developed, enabling the animals to produce a howling sound out of all proportion to

their size. They have long, prehensile tails, and ugly, naked faces surrounded by long hair. See Monkey.

Howrah. District, subdivision, and town of India, in the Burdwan division of W. Bengal. The area of the district is 561 sq. m. Rice is the most important crop. The district is a great industrial centre, containing cotton, jute, and other factories, engineering workshops, ironworks, dockyards, and similar undertakings. The exports include rice, hides, cotton goods, bricks, and ropes; imports are European piece goods and wheat.

Howrah city, a small village in the 18th century, is now an important manufacturing town on the right bank of the Hooghli, opposite Calcutta. It is the terminus of rlys. from Bombay, Peshawar, and Assam, and gives its name to the New Howrah bridge across the Hooghli, opened to traffic Feb., 1943. Pop. of dist., 1,490,304; city, 429,689.

Howth. Parish and seaport of co. Dublin, Eire. It is situated on a promontory forming the N. side of Dublin Bay, 8 m. by rly. N.E. of the capital. The Hill of Howth rises to 562 ft. Here in July, 1914, the Irish Volunteers landed rifles and ammunition despite the interference of a British regiment. Returning to Dublin, the soldiers, being harried by a mob in the city, opened fire, killing three people and wounding 38. This was the first armed clash between troops and populace in seven years of trouble. Pop. 4,000. Pron. Hoath.

Hoxton. Suburb of N. London. Known formerly as Hogsdon, Hogsdon, Hoggesdon, Hoggston, and Hocheston, it is in the bor. of Shoreditch. It is traversed from S. to N. by New North Road, and

Hoy, Orkney Islands. The Old Man of Hoy, a pillar of rock on the north-west coast

has Kingsland Road on the E. The L.C.C. technical institute, formerly Aske's Haberdashers' School, marks the site of almshouses and schools founded by Robert Aske, alderman and haberdasher, in 1688. A mansion known as Balmes House in the 17th century, and rebuilt by Sir G. Whitmore, was once the residence of Richard de Beauvoir, whose name is preserved in that of De Beauvoir Town; it became a private lunatic asylum, of which Charles and Mary Lamb were inmates. The Geffrye Museum (*q.v.*) in Kingsland Road occupies the site of almshouses founded in 1715 by Sir Robert Geffrye; the old chapel remains. In Hoxton Fields Ben Jonson killed his fellow player Gabriel Spencer in a duel in 1598. The Britannia Theatre, rebuilt 1858, was destroyed in an air raid in 1941. Hoxton is a centre of the cabinet-making industry.

Hoy (from Dutch *hul*, hulloo). Single-masted sailing vessel originally used as a ferry for taking passengers from shore to an ocean-going ship. It was hailed by any person desiring passage, hence its name. A larger type of vessel with the same name was used for carrying passengers and goods on short coastal journeys. Hoyes still carry goods between ship and shore where there is no port and the shallow water prevents seagoing vessels from coming close in.

Hoy. Second largest of the Orkney Islands, Scotland, and situated about 2 m. S.W. of Pomona. Its extreme length is 13½ m., extreme breadth 8 m., and area 53 sq. m. The highest summit is Ward Hill (1,565 ft.), 2 m. from which is the famous Dwarfie Stone, referred to in Scott's *Pirate*, 6½ ft. high, with its hollowed-out chambers. Long Hope, on the S. coast, is a good natural harbour. The Old Man of Hoy (450 ft.) is a detached pillar-shaped rock off the N.W. coast. From this point to Berry Head in the S.W. are fine cliffs of red sandstone, over 1,000 ft. high.

Hoylake. A watering-place of Cheshire, England. On the Dee, at the entrance to the estuary, on the peninsula of Wirral, it is 8 m. W. of Birkenhead on the Wirral electric rly., also served by steam rly. Here are the golf links of the Royal Liverpool club, opened in 1869, and the scene of championship matches. With West Kirby, Hoylake forms an urban district. Pop. 28,000.

Hoyland, NETHER. Urban dist. of the W. Riding of Yorkshire, England. It is 5½ m. S. by E. of

Barnsley, with a rly. station, and has collieries and a clothing factory. Pop. 14,520.

Hoyle, EDMOND (1672-1769). English writer on games. He is said to have been a barrister; was certainly giving lessons on whist in London in 1741; and died at Welbeck Street, London, Aug. 29, 1769. The first to write scientifically on any game, he systematised the theory of whist in his *Short Treatise*, 1742. He published works on piquet, quadrille, brag, backgammon, and chess. Hoyle's rules and doctrines have been constantly enlarged by editors, and the phrase "according to Hoyle" refers to him.

Hrdlicka, ALMS (1869-1943). American anthropologist. Born at Humpolec, Bohemia, March 29, 1869, he studied in New York and Paris. Having qualified as a doctor, he made investigations in mental pathology and anthropology, 1894-99; and joined several American natural history museum expeditions, 1898-1903. In the physical anthropology division of the national museum at Washington he became assistant curator, 1903, and curator, 1910. He journeyed to Egypt, the Balkans, Siberia, Mongolia, and all over the New World. Among his publications are *Early Man in N. America*, 1907; in *S. America*, 1912; *The Peoples of the Soviet Union*, 1942; *Alaska Diary* (1926-31), 1943. He died Sept. 5, 1943. *Pron.* Dlitska.

Hron. A river of Hungary. Rising near the Low Tatra, it flows W. and then S., reaching the Danube just below Esztergom, after a course of about 150 m. Another name is Gran.

Hroswitha, ROSWITHA, OR HROTSVITH (c. 935-1000). German poet and dramatist. A Benedictine nun of Gandersheim, she wrote religious poems in Latin, versified church legends, and also wrote six comedies modelled on those of Terence, but of a wholesome Christian tone. Her works were published in 1858, ed. K. A. Barack. The comedies and her epic, Otto, have been rendered into German. Anatole France mentions the performance of the comedies at the Théâtre des Marionnettes in Paris.

Hsingan. One of the nine north-eastern provinces of China, bordering the U.S.S.R. and Outer Mongolia on the W. It contains seven counties with Hulun as its capital. The Changchun rly. runs through the prov., with Manchouli as its terminus. The Ta

Hsinganling range is covered with thick forests where the Mongol nomads graze their flocks. The prov. is generally mountainous and sparsely inhabited. Area, 103,918 sq. m. Pop. 1,293,000.

Hsingking. This city, the capital of Manchuria, is now known as Changchun (*q.v.*).

Hsuan Tsang (c. 605-664). A Chinese traveller. Born near Honan Fu, he became a Buddhist monk and early gained a reputation for wisdom and piety. He undertook alone the perilous journey to India in order to visit the sacred scenes and procure Indian books of devotion. Crossing the Gobi desert, despite great hardships, he reached Peshawar, visited the principal Buddhist shrines, and learned Sanskrit. After several years spent in travel in India he passed on to Assam and thence made his way to Kabul. At the command of the emperor Tai Tsing, he wrote an account of his travels in 648.

Huacho. Seaport of Peru, 70 m. N.N.W. of Callao, where ocean liners call frequently. It is connected with Lima by rly. via Ancon and is on the Pan-American Highway. It has cotton-seed oil and sugar mills. Pop. 13,000.

Huallaga. River of Peru, a headstream of the Amazon. It rises in the Andes, at an alt. of 13,000 ft. above sea level, in about lat. 10° 42' S., and takes a generally N. course to join the Marañon. Its upper valley between the E. and Central Cordilleras is the province of San Martín. Its length is about 670 m. It is navigable for shallow craft for about 350 m., but larger vessels cannot get beyond Laguna, only 30 m. from its junction with the Marañon. *See* Amazon.

Huancavelica. Dept. and town of Peru. The dept. is bounded on the N. by Junín and lies W. of Ayacucho, E. of Lima. A mountainous region traversed by the Andean system, it is rich in gold, silver, copper, lead, and mercury. Area, 8,297 sq. m.; pop. 244,595. Huancavelica, the capital, is a mining town, with extensive smelting works. The quicksilver mines in the vicinity were first worked in 1566, and are still important. Pop. 8,000.

Huangayo. A town of Peru, capital of the dept. of Junín. On the central highway from Lima to Cuzco, it is also served by rly. and has a daily air service. It is the centre of important mining and agricultural districts. Alt., 10,500 ft. Pop. 20,000.

Huanchaca. Town of Bolivia, in the dept. of Potosí. It stands at an elevation of 13,450 ft. above sea level, 84 m. S.W. of Potosí, on a branch line from the rly. connecting with Antofagasta in Chile. It is the chief silver mining centre in Bolivia.

Huang Hsü OR KHWANG HSÜ (1872-1908). Emperor of China. Nephew of the emperor Hien-fang, he was born Aug. 2, 1872, and in 1875 was proclaimed emperor, his name being changed from Tsai-tien. The regency was vested in the dowager empresses, Tsze Tai, his aunt, and Tse An, widow of his predecessor, and on the death of Tse An in 1881 his aunt ruled supreme, with Li Hung-chang as principal adviser. After the defeat of China by Japan, 1894-95, Huang Hsü tried to free himself from his aunt's power, but in 1898 she organized a *coup d'état* and seized and imprisoned him. He died Nov. 14, 1908.

Huánuco. Dept. and town of Peru. The dept. is bounded on the W. by Ancash and on the S. by Junín. The surface is mountainous, being traversed by the Cordillera Oriental. Gold, silver, and quicksilver are common, and the extensive forests yield valuable timber. Mining and agriculture are the principal occupations. Area, 15,426 sq. m.; pop. 234,024. Huánuco, the capital, stands in a beautiful valley, at an alt. of over 6,000 ft. Pop. 10,000.

Huaraz. A city of Peru, the capital of the dept. of Ancash. It stands on the river Huaraz, at an alt. of 10,000 ft., 183 m. N. by W. of Lima, and is connected by motor road and rly. with Chimbote. Pop. 20,000.

Huascarán. Twin-peaked volcano of Peru, in the dept. of Ancash. It is the loftiest mountain mass in the Peruvian Andes. Alt. 22,180 ft.

Huayna-Capac (c. 1450-1525). Inca ruler of Peru. During his reign the Peruvian empire attained its height. The remains of his palace are among the most interesting monuments of the civilization of the Incas. *See* Inca.

Hubbard. Glacier or ice mass of Alaska, U.S.A. It descends from Mt. Hubbard to the head of Yakutat Bay. The mountain reaches an elevation of 12,065 ft.

Huberman, BRONISLAW (1882-1947). Polish violinist. A Jew, he was born at Czenstochowa, Dec. 19, 1882. At 10 he went to Berlin to study under Joachim, but was forced through poverty to undertake a series of concerts. Patti

heard him in London in 1894, and introduced him to Vienna, where he had a success and won the admiration of Brahms. There followed a career as a virtuoso, his approach being intellectual and his tone lacking something in sweetness. Intensely alert to politics, Huberman wrote on Pan-Europeanism, and led the musicians' opposition to Hitler. He founded and financed the Palestine orchestra, persuading Toscanini to direct concerts. He died June 15, 1947.

Hubert (656-727). French saint and bishop. A nobleman of Aquitaine, he spent his youth at the court of Theodorik III. One day, when hunting, he saw a stag with a cross growing between his antlers, which brought about his conversion. He then became a monk, was ordained, and later was successively bishop of Maastricht and Liège. He did much to promote Christianity among the tribes in the forest of Ardennes. He is the patron saint of hunters. His festival is kept on Nov. 3.

Hubertusburg, TREATY OF. Peace signed Feb. 15, 1763, between Prussia and Austria, which ended the Seven Years' War. England, France, and Spain having just come to terms, representatives of the other powers met at Hubertusburg, in the castle of the elector of Saxony, Austria's ally. The demands of the empress Maria Theresa were rejected by Frederick the Great and in the end peace was made on the basis of the *status quo*, Austria thus giving up all hope of regaining Silesia. Frederick promised to evacuate Saxony, and to do his best to make Joseph, Maria Theresa's son, the next emperor. The castle of Hubertusburg, 6 m. E.N.E. of Grimma, Saxony, E. Germany, was built c. 1720 by the elector Augustus. It is now a public building. See Seven Years' War.

Hubli. Municipality of India, in Dharwar district, Bombay. Hubli city is a trade centre, and its chief industry is the manufacture of cotton goods. Pop. 106,000.

Hübnerite. Ore mineral of tungsten; a member of the mineral series ferberite-wolfaramite-hübnerite. This series consists of isomorphous mixtures of pure ferberite (iron tungstate) and pure hübnerite (manganese tungstate, $MnWO_4$). The term sometimes includes all members containing more than 80 p.c. of the hübnerite molecule. See Wolframite.

Huc, ÉVARISTE RÉGIS (1813-60). French missionary and traveller. Born at Toulouse, Aug. 1, 1813, he

joined the Lazarist Fathers, 1839, and after a sojourn in N. China made an adventurous journey to Lhasa, accompanied by Joseph Gabet and a converted Tibetan lama. Compelled by Chinese influence to go back to Canton, he returned to France in 1852, visiting Rio de Janeiro, India, Egypt, and Palestine on the way. His *Souvenirs d'un Voyage dans la Tartarie, le Thibet, et la Chine*; and *Le Christianisme en Chine, en Tartarie, et en Thibet*, published 1844-58, were quickly translated into English. Huc died in Paris, March 31, 1860. Consult *Père Huc et ses Critiques*, Prince Henry of Orleans, 1893.

Huch, RICARDA (1864-1947). German novelist and essayist, b. at Brunswick, July 18, 1864. She studied at Zürich and in 1891 was appointed its librarian. She married first an Italian physician, and, in 1906, her cousin, the lawyer Richard Huch. Gaining reputation as a poetess under a pseudonym, from 1893 she rapidly climbed to the first rank of contemporary novelists. Many of her romantic stories have an Italian, some a Renaissance, setting. Her historical, philosophical, and religious writings deal with Luther, Garibaldi and the *Risorgimento*, Baron Stein, and Bakunin; *Alte und Neue Götter*, 1930, was her last large-scale work. The first woman to receive the Goethe prize, she died Nov. 17, 1947.

Huckaback. Linen or partly linen fabric with slightly roughened surface and sometimes a damask-like pattern, used for towels, etc.

Huckleberry. Fruits of several low shrubs of the genus *Gaylussacia*, of the family Ericaceae. Natives of N. America, the plants resemble and are nearly related to the whortleberries and cranberries (*Vaccinium*).

Huckleberry Finn, THE ADVENTURES OF. Story by Mark Twain, published 1884, and noticed more fully under Tom Sawyer, The Adventures of—of which book it is a sequel.

Hucknall. Market town and urban dist. of Nottinghamshire, England. It is 8 m. N. of Nottingham, and has stations (London Midland region) on two rlys. Around it are coal mines, while another industry is the making of hosiery. Near is Newstead Abbey (q.v.), the home of Lord Byron, who is buried in Hucknall church. Market day, Fri. Pop. 21,000.

Hucks, BENFIELD CHARLES (1884-1918). British pioneer airman. Born in Essex, he was edu-

cated as an engineer, and gained his flying certificate in 1911. He was one of the starters in the Daily Mail circuit of Britain competition that year; was the first Englishman to loop the loop and fly upside down, and in 1913-14 drew crowds to his demonstrations of acrobatic flying. He did valuable work as a test pilot in the First Great War. Hucks died of pneumonia, Nov. 6, 1918.

Huckster. Petty dealer in small wares, either itinerant or trading at a shop or booth. The term has been applied specifically to small traders who retail farm produce bought at the market. The word, formerly used for a broker or middleman, is now often applied disparagingly to one who has an eye for a petty bargain or seeks gain by questionable methods.

Huddersfield. Co. and mun. borough of the W. Riding of Yorkshire, England. It stands on the Colne, 16½ m. S.W. of Leeds and 25½ m. N.E. of Manchester by rly. It is also served by canals. The chief buildings are the church of S. Peter, rebuilt in

Huddersfield arms

the 19th century, the town hall and municipal buildings, a fine public library, and an art gallery. There are a market hall, an infirmary, and the Ravensknowle museum. Among the schools are Huddersfield college, girls' high school, the Almondbury grammar school, and a technical school. The parks include Greenhead and Beaumont.

Huddersfield's staple industry is the making of cloth and worsted; others are the manufacture of cotton goods and machinery, iron founding, and engineering. Here are large works producing dyes and chemicals. The corporation owns the baths, cemeteries, markets, and abattoirs. There are trolley and motor bus services within the town and from it to neighbouring places.

Huddersfield existed in Anglo-Saxon times, but remained a village until the 17th century. In 1599 William Ramsden became lord of the manor, and his descendants were the principal landowners until 1920, when the corporation purchased over 4,000 acres for £1,300,000. In the 17th century the manufacture of woolen goods was introduced and with the advent of steam the town became a manufacturing centre. Consequently its streets, buildings,

and general appearance are modern. Huddersfield became a municipality in 1868. It returns two members to parliament. In 1919 it was granted a court of quarter sessions. Huddersfield Town, a famous football club, headed the championship table in three successive seasons, 1925-27. Market day, Tues. Pop. est. 124,240.

Hudibras. Satiric poem by Samuel Butler originally published in three parts, 1663-78. The story, which is merely the peg on which the poet hung his satire against the Puritans in particular and the Commonwealth people in general, tells how Sir Hudibras and his squire Ralpho set out to put down a bear-baiting, and of how Hudibras wooed his lady and fought the conjuror Sidrophel. It is written mostly in easy octosyllabic couplets with at times extraordinarily forced rhyming; hence this kind of verse has come to be termed Hudibrastic. See Butler, Samuel.

Hudson. Twin-engine reconnaissance bomber employed by the Allies in the Second Great War. Built by the Lockheed Aircraft corporation as a conversion of the Lockheed 14 air-line transport, it was the first, and one of the most successful, military aircraft ordered in the U.S.A. for the R.A.F., being used extensively by Coastal Command. The majority of Hudsons were flown across the Atlantic to the European and Mediterranean theatres of war.

Hudson. Chief river of New York state, U.S.A. Rising in the Adirondack Mts., it flows generally S. for about 300 m., entering New York Bay by an estuary commonly called North river. Its banks in places are backed by lofty hills, notably the Catskills below Albany and the Highlands below Newburgh, where the river traces its course for about 15 m. through heights of 1,500 ft. Below the Highlands it broadens into Haverstraw Bay, then the Tappan Sea, and farther down the Palisades, a mass of trap rock, line its bank for nearly 20 m. and reach to 550 ft. Falls occur in the upper reaches, Glens Falls descending 50 ft.

The Hudson is tidal and navigable for large ships to Troy, 150 m. from

its mouth. Below Albany it is an estuary. Its chief tributaries are the Mohawk, Sacandaga, and Wallkill. From 59th Street, New York, to the Battery, the Hudson assumes its character as a component of a great port. Berths for ocean liners cover the New York shore, facing industrial plants and docks on the New Jersey side. Ferryboats, freighters, and tugs crowd the river. Besides ferries, there are vehicular and rly. tunnels and bridges. Other large cities on its banks are Jersey City and Hoboken. Higher up are Poughkeepsie, Kingston, West Point, and Ossining. The commercial value of the Hudson is increased by the Erie Canal, which joins it to Lake Erie, and part of the New York state barge canal.

Discovered in 1524 by Verrazano, it was explored in 1609 by Henry Hudson, after whom it is named, and on it in 1807 steam navigation was first exploited by Robert Fulton. Historically, the valley of the Hudson was the great route from the Atlantic seaboard to the W. of the Appalachian highlands. The Hudson Gap or the Hudson-Mohawk Pass provided the only easy gateway to Montreal or Buffalo, and so was a key in the early struggles between British and French and in the War of Independence.

Hudson. City of New York, U.S.A., the co. seat of Columbia co. It stands at the head of deep-water navigation on the Hudson river, 28 m. S. of Albany, and is served by rlys. Its institutions include a state armoury. Industries are concerned with machinery, clothing, Portland cement, lumber, hosiery, knitted goods. Settled in 1783, Hudson received its charter, one of the state's oldest, in 1785. A port of entry in 1790, it was until the war of 1812 a foreign trade centre and the base of a whaling fleet. Pop. 11,517.

Hudson River, U.S.A. View up the river from West Point, 50 miles north of New York City

Hudson, George (1800-71). British financier. Son of a Yorkshire farmer, he became an apprentice and then partner in a drapery firm in York. A legacy of £30,000 was invested by him in the North Midland rly., and in 1837, when lord mayor of York, he became chairman of the newly organized York and N. Midland rly. Lines from York to Newcastle and Edinburgh were constructed under his influence, and more than 1,000 miles of line were under his control during the railway mania of 1844, at which time his holdings amounted to £320,000.

An issue of stock on the amalgamation of the Newcastle and Berwick and Newcastle and N. Shields rlys. afforded Hudson an opportunity of appropriating shares to the value of £145,000, by omitting to enter the increase of issue in the company's books. Further dishonest dealings occurred, and in 1847, when the inevitable slump occurred, these transactions were brought to light. No legal action was taken against Hudson, but he was obliged to go abroad, though he was M.P. for Sunderland 1845-59. The "railway king" died Dec. 14, 1871.

Hudson, Henry (d. 1611). English sailor. The son probably of a London merchant, he sailed on the *Hopeful* in 1607 in the service of the Muscovy Company in search of a N.E. passage to the Spice Islands, and touched at Greenland and Spitsbergen. In 1609 he set out from Amsterdam in the service of the Dutch E. India Co., in the *Half Moon* of 80 tons, with a crew of 20, crossed the Atlantic, and explored the Hudson river. In 1610 he sailed again to find a North-West passage, investigated the bay later called after him, and was there caught in the ice. Discontent, occasioned by the shortage of victuals, caused a mutiny, and in June, 1611, Hudson, his son, and seven others were set adrift in a small boat. Nothing was ever heard of them.

George Hudson, British financier
After F. Grant

Hudson, ROBERT SPEAR (b. 1886). British politician. He was educated at Eton and Magdalen College, Oxford, became an attaché in the diplomatic service in 1911, and was a first secretary, 1920-23. He was Conservative M.P. for Whitehaven, 1924-29, and sat for Southport from 1931. Hudson became minister of Pensions in 1935; secretary to the department of Overseas Trade, 1937-40; and minister of Agriculture and Fisheries, 1940-45. He was made a privy councillor in 1938 and C.H. in 1944.

Hudson, WILLIAM HENRY (1841-1922). British author and naturalist. He was born near Buenos Aires, Aug. 4, 1841, and did not leave Argentina for Europe until 1874. In England he lived obscurely, supporting himself as a free-lance writer. He died Aug. 18, 1922.

W. H. Hudson,
British author
Elliot & Fry

Hudson's books show him to have been as close a student of his fellow man as of nature. He tries to bring before his readers the charm of the unknown, and to emphasise that the pleasure derived from discovering things for oneself is infinitely greater than that gained from books. Even in ornithology, his chief subject, he remained an amateur.

The Purple Land that England Lost, 1885, is a romance of Uruguay. It was followed by Argentine Ornithology, 1888-89 (with P. L. Slater); The Naturalist in La Plata; Idle Days in Patagonia. Then came British Birds; Nature in Downland; Birds and Man. El Ombu, 1902, marks a return to stories of adventure in S. America; Hampshire Days, 1903, dwells on the delights of the New Forest; Green Mansions, 1904, is a romance set on the upper Orinoco; Afoot in England, 1909, contains appreciations of the open country and wonderful pictures of home life in rural districts. Hudson's other works include A Shepherd's Life; the autobiographical Far Away and Long Ago; The Book of a Naturalist; lastly, A Hind in Richmond Park.

He is commemorated by the bird sanctuary in Hyde Park, where Epstein carved the figure of Rima (in Green Mansions). Hudson's Letters, ed. E. Garnett, appeared in 1923; *consult also*

W. H. H.: a Portrait, M. Roberts, 1924; W. H. H.: The Vision of Earth, R. Hamilton, 1946. *See* Rima.

Hudson Bay. Inland sea of N.E. Canada. Named after Henry Hudson (q.v.), who explored it in 1610, it is entered from the Arctic by Fury and Hecla Strait and Fox Channel, and from the Atlantic by Hudson Strait, its S. extremity narrowing into James Bay between Ontario and Quebec. Its length (including James Bay and Fox Channel) is 1,300 m., its breadth 590 m., and its area 567,000 sq. m. The drainage basin has an area of 1,486,000 sq. m., the principal rivers being the Nelson, Churchill, Hayes, Albany, Severn, Nottaway, Rupert, East Main, Great and Little Whale. Owing to drift and shore ice, safe navigation through Hudson Strait lasts for only three months of the year, but it is considered practicable with ice-breakers to maintain navigation from mid-June to the end of Oct. The only good harbour is Port Churchill.

The Hudson Bay rly., from Le Pas (Manitoba) to Churchill, has reduced the route from Winnipeg and from Edmonton to Liverpool by 500 and 1,000 miles respectively. The great value of this route is that it lessens rly. congestion when the newly harvested

wheat is sent E. from the Canadian prairie. The shores of the bay are dotted with posts of the Hudson's Bay Company, to which the natives bring their furs.

Hudson's Bay Company. Trading organization in Canada. In 1670 England had colonies on the Atlantic coast of N. America, in the district known as New England, while France had some along the St. Lawrence. Behind these was a vast country inhabited only by Indians and visited, mainly for furs, by a few white men. When the question of ownership arose after French depredations at Port Nelson in 1682, the English claim to Hudson Bay was based on the discoveries of Captains Davis, Hudson, Foxe, and others.

Those interested in the fur trade, however, were not indifferent to the fate of the almost useless land around Hudson Bay, and to some of them Charles II, in 1670, made a grant. He gave his cousin, Prince Rupert, and 17 other noblemen and gentlemen "the sole trade and commerce of all those seas, straits, bays, rivers, lakes, creeks, and sounds in whatever latitude they shall be, that lie

within the entrance of the strait commonly called Hudson Strait together with all the land, countries, and territories upon the coast, and confines of the seas, bays, . . . aforesaid." The prince and his associates were called the governor and company of Adventurers of England trading into Hudson Bay; and the vast district granted to it was called Rupert's Land and also the Hudson's Bay Territories, and its first settlements were trading posts built at the mouths of rivers running into

Hudson's Bay

James Bay at the S. end of Hudson Bay.

The company began to trade in fur with the Indians, and there was a good deal of trouble, often bloodshed, between its servants and the French, also seeking for furs. Its position was strengthened when, by the treaty of Utrecht in 1713, France ceded the whole of the Hudson Bay region to England. In 1749 a parliamentary inquiry was held into its affairs, but its privileges were confirmed. After Canada became an English possession, in 1763, the rival North-West Company of Montreal sent agents into the W., and early in the 19th century there was serious trouble around the Red River. Some fighting occurred, especially in 1816, but in 1821 the two companies were amalgamated. In 1821 George IV gave the united company, still known as the Hudson's Bay Company, the exclusive right of trading with the Indians in those parts of N. America which had hitherto been outside its operations.

Further Trading Areas Granted

These included the Mackenzie, Peace, and Athabaska valleys. In addition, there was the vast territory W. of the Rocky Mts., stretching approximately from what is now the N. of British Columbia to what is now S. Oregon, but in this area the company had to share its rights with American citizens in accordance with an agreement for joint occupancy made between the British and American governments in 1818. In 1846 the boundary between British and American possessions W. of the Rockies was fixed at the 49th parallel; and the trade of the district S. of that line was lost to the Hudson's Bay Company. In 1849 the British government granted Vancouver Island to the company for the purpose of founding a colony, but the grant was withdrawn in 1859, the island becoming a crown colony. At the same time the licence of exclusive trade in the N.W. Territories, first granted by George IV, was allowed to lapse.

At this time Ontario and Quebec were increasing in population and importance, and it was clearly impossible for something like 2,300,000 sq. m. of land, nearly two-thirds of the whole country, to remain in the possession of a single company. In 1857 parliament appointed a committee, which recommended that the Red River and Saskatchewan districts should be given up "on equitable principles," but that the company's

trading privileges should remain untouched. In 1867 the first parliament of the newly formed dominion of Canada expressed the desire to include the district under its authority.

In 1869 the company agreed to surrender its lands, which became the property of Canada as a whole, and out of which three provinces were afterwards carved. As compensation it received £300,000 and a good deal of fertile land, as well as a small piece adjoining each of its trading stations. The so-called fertile belt, now the S. part of the three prairie provinces, consisted of about 140,000,000 acres, of which one-twentieth was reserved for the company. The exact arrangements were completed in 1872. This land made the company one of the largest landholders in Canada, and since 1872 it has been engaged in developing and selling it. As a fur trading corporation the company has continued its operations without hindrance; but for some time the bulk of its profits have been derived from general trading.

From 1889 until his death in 1914 Lord Strathcona was the governor. During the First Great War the company was appointed purchasing agent for the French military administration, and transported foodstuffs for the French civil population. An agency was maintained at Archangel, and munitions from France for Russia and Rumania were sent there.

Since 1931, when Sir Patrick Ashley Cooper became governor, the company's affairs in Canada have been under an administration whose chief officer is the managing director for Canada. This committee is responsible to the board in London. The company is known in the cities of Canada for its departmental stores, the principal ones being at Winnipeg, Edmonton, Calgary, Victoria, Vancouver, and Saskatoon. It has fur trading posts throughout the Canadian Arctic. Wholesale activities are centred in Winnipeg and Vancouver, and include the sale of tea, coffee, tobacco, and blankets. During the Second Great War the company discontinued its London fur auctions, but in 1946 they were resumed. *Consult* The Honourable Coy., D. MacKay, 1936.

Hudson's Bay Territories. Name given to the district, now the northern part of Canada, at one time the property of the Hudson's Bay Company (*v.s.*). In 1858 British Columbia was formed out of the territories, and in 1869 the

whole was taken over by the crown and called the North-West Territories (*q.v.*).

Hudson Strait. Broad channel between the Canadian prov. of Quebec and Baffin Island. It connects the N. Atlantic with the Arctic Ocean, through Hudson Bay and Fox Channel. Its length is about 500 m. and it is from 80 m. to 140 m. broad. The strait has a depth varying between 100 and 140 fathoms, and contains numerous islands. Ungava Bay is a large indentation on the S. shore. A tidal range of 64 ft. is recorded, and 40 ft. at spring tides is usual; the strait is never frozen, but is blockaded by drift ice which prevents navigation except for a short period in summer.

Huế (Chinese, Thua-Thien). Town of Vietnam, cap. of S. Vietnam (Annam). It stands on the left bank of the Huong-giang or Hué, a few miles from its mouth in the China Sea, and is built on what is virtually an island, the river flowing on three sides and a canal cutting off the fourth. It has rly. connexion with Tourane and Hanoi. Hué fell to the French in 1883 and became the seat of the French resident-general. Its European quarter and the dwellings of the upper classes are on the right bank connected by an iron bridge with the citadel. In the vicinity are the sarcophagi of the ancient rulers. Pop. 13,056.

Hue and Cry. In early English law, term given to the procedure adopted to secure the arrest of a criminal. The constable of the parish, on information of a crime being laid, and any other person discovering a felony, might call upon the inhabitants to follow in the tracks of the suspected criminal, and when the pursuit reached the borders of the next parish the hue and cry was passed on in turn to its constable. No defence was permitted to persons taken by hue and cry if evidence of guilt was found on them. In old French *hu et cri*, the term is derived from *huer*, to hoot or raise a cry, and *crier*, to cry.

Hueffer, FORD MADOX. This British writer adopted Ford as his surname in 1923. *See* Ford, F. M.

Huehuetenango. Dept. in the W. of Guatemala. Mountainous and well watered, it produces lead, coffee, sugar, wheat, oats, and maize. The capital is Huehuetenango, near the sources of the Chiapas and Cajabon rivers, in a fertile plain, 85 m. N.W. of the ruined city of Guatemala. In the surrounding district are lead mines

and the ruins of an ancient Indian town. Pop. of capital, 14,178.

Huelva. Maritime prov. of S.W. Spain. It is bounded on the N. by Badajoz, S. by the Atlantic, E. by Seville, and W. by Portugal. The surface is mountainous, and is traversed by the Odiel, Tinto, and other rivers, while it shares with Seville the marshlands (Las Marismas) of the Guadalquivir delta. Valuable timber and chestnut trees are grown, and oil, wine, fruit, cork, etc., produced. Its chief wealth is in the famous copper mines of Rio Tinto and Tharsis. There are numerous mineral springs in the prov. Area, 3,906 sq. m. Pop. 373,041.

Huelva. A town and port of Spain. The capital of the prov. of Huelva, it is the ancient Onuba. Near the junction of the rivers Odiel and Tinto, 9 m. N. of the Gulf of Cadiz, it has a good harbour and is the port for the Rio Tinto and Tharsis copper mines. In addition to copper, iron, manganese, and quicksilver, it exports wine, fish, grapes, olives, cereals, and cork. Fishing and plaiting of esparto grass are leading occupations. Founded by the Carthaginians and colonised by the Romans, Huelva is still supplied with water by a Roman aqueduct. It is a winter health resort and a bathing place. Its old Moorish mosque is now the church of San Pedro. Pop. 64,006. See Palos de la Frontera.

Huércal Overa. Town of Spain, in the prov. of Almería. Near the river Almanzora, on the Lorca-Baza rly., 43 m. N.E. of the town of Almería, its industries include the manufacture of linen and soap. There are small lead mines in the vicinity. Pop. 17,600.

Huerta, VICTORIANO (1854-1916). Mexican soldier. Of humble birth, he entered the army as a boy

and had an uneventful military career until 1902, when, having suppressed an Indian revolt in Yucatan, he was promoted brigadier-general. He served Porfirio

Victoriano Huerta,
Mexican soldier

Díaz faithfully, and retained his military power under Madero. His campaign against Orozco in Chihuahua, 1912, brought his promotion to general, and in 1913, after commanding the government troops against Félix Díaz, he suddenly deserted Madero, who was assassinated, and was himself

elected provisional president. But popular feeling was against him, and in 1914 he resigned. He went into exile and died Jan. 10, 1916.

Huesca. Frontier prov. of N. Spain. It is bounded on the N. by France, on the E. by Lerida, and on the W. and S. by Saragossa. It is drained by tributaries of the Ebro, and its heights are covered with dense forests of pine, fir, and oak. In the valleys wine, fruit, and cereals are produced, and mulberries cultivated for silk-worms. Area, 5,849 sq. m. Pop. 225,653.

Huesca. City of Spain, capital of the prov. of the same name. On the right bank of the river Isuela, 45 m. by rly. N.E. of Saragossa, it is built on a hill and enclosed by a double row of dilapidated walls, and has narrow and tortuous streets. There are a fine 15th century Gothic cathedral, noted for its beautiful altar-piece, the old palace of the kings of Aragón, an episcopal palace, ancient churches, philanthropic and scholastic institutions, and a museum. Huesca university, founded in 1354, was united in 1845 with that of Saragossa. The trade of the city is largely connected with wine and agricultural produce. As the Roman Osca it was already important at the time of Sertorius (*q.v.*), who founded here his school in 77 B.C. and here was murdered. Under the Moors Huesca was a stronghold, taken in 1096 by Pedro I of Aragón, who made it his capital. Pop. 14,817.

Huet, PIERRE DANIEL (1630-1721). French scholar and ecclesiastic. Born at Caen, Feb. 8, 1630, he was educated there by the Jesuits, and as a young man travelled widely in Holland and Scandinavia. In Paris he became known as a scholar and theological controversialist; his interests included chemistry, anatomy, painting, and romances. For a time he acted with Bossuet as tutor to the dauphin. Ordained priest in 1676, he became bishop of Soissons, 1685, and of Avranches, 1689, and abbot of Fontenay, 1699. But from 1711 until his death, Jan. 26, 1721, he engaged in literary work at a Jesuit establishment in Paris. Among Huet's works were the editing, for his pupil, of the famous Delphin edition of the classics; an

Pierre D. Huet,
French scholar
From a print

edition of Origen, 1668; *Demonstratio Evangelica*, 1679; a work on the history of Cartesian philosophy, 1692; and a study of the origins of romances.

Hufuf. This Arabian town is spelt Hofuf in this work.

Hügel, FRIEDRICH, BARON VON (1852-1925). Anglo-Austrian Biblical critic. Born at Florence, he was the eldest son of Baron Karl von Hügel, Austrian botanist and diplomatist, and of the daughter of General Farquharson. He settled in England in 1871 and became naturalised. As a result of typhus the same year, he became handicapped by deafness, and for fifteen years was unable to undertake any sustained mental activity. Eventually, however, his studies in Biblical criticism commanded wide respect. His works include *The Papal Commission and the Pentateuch*, with Prof. C. Briggs, 1906; *The Mystical Element in Religion*, 2 vols., 1908-9; *Eternal Life*, 1912-13. Died Jan. 27, 1925.

Huggins, SIR WILLIAM (1824-1910). British astronomer. Born Feb. 7, 1824, he early took an

Sir William Huggins,
British astronomer

interest in astronomy and erected a private observatory at Tulse Hill, London, where he made a study of Mars, Jupiter, and Saturn.

Taking up spectrum analysis he laid the foundation of astrophysics. He first showed that one of the constituents of galactic nebulae was hydrogen, and formulated the theory that they were not star clusters, but masses of glowing gas. Huggins was a pioneer in spectroscopic photography, and with the aid of the dry plate revealed celestial objects otherwise invisible. He invented a method of studying the solar prominences, and showed the presence of calcium in them. President of the Royal Astronomical Society, 1876-78, of the British Association, 1891, and of the Royal Society, 1900-05, he received many honours from scientific bodies. He received the O.M. in 1902, and died May 10, 1910.

Hugh (c. 1135-1200). English saint, known as Hugh of Lincoln, or Hugh of Avalon. Born at Avalon, Burgundy, he became a monk at the Grande Chartreuse, where after a time he was made procurator. About 1164 he was made by Henry II prior of Witham, a new Car-

thusian house in Somerset, and in 1186 bishop of Lincoln. He did much to reform the clergy in his diocese, while he was equally ready to stand up to the king when the rights of his office were assailed, as when in 1197 he refused to supply Richard I with knights for service abroad. He died in London, Nov. 16, 1200, and his festival is kept on Nov. 17. He was canonised in 1220. A swan always figures as the companion of the saint, the story being that he kept a pet swan. (*Consult* Lives, R. M. Woolley, 1927; J. Clayton, 1931.)

Another Hugh, called Hugh of Wells, that city being his birthplace, became bishop of Lincoln in 1209, remaining there until his death, Feb. 7, 1235.

Hugh. Boy of Lincoln, England. He was found dead, Aug. 28, 1255, in a well belonging to a Jew named Copin. He was about 10 years old. It was believed that the Jew had scourged and crucified the boy, and the result was an outbreak of violence against the Jews. The story, very popular in medieval England, is the subject of Chaucer's *Priores's Tale*.

Hughenden. Parish and village of Buckinghamshire, England. It is 1½ m. N.E. of High Wycombe, at the foot of the Chilterns. At Hughenden Manor the earl of Beaconsfield (*q.v.*) lived from 1848; it was given to the National Trust, 1949, and opened as the Disraeli museum. In its noble park is the parish church, containing Queen Victoria's memorial to the statesman, who was buried outside the E. window of what is known as the De Montfort chapel, notable for its Tudor monuments. The church was rebuilt, 1874-75. To the N.W. is Bradenham, the Hurstley of Beaconsfield's last novel, where he lived in his youth.

Hughenden. Town of Queensland, Australia. It stands on the Flinders River, 236 m. inland by rly. S.W. from Townsville. Agriculture is possible only by irrigation from artesian bores. The town serves the cattle and sheep rearing district W. of the Great Dividing Range. Pop. 1,875.

Hughes, ARTHUR (1832-1915). British painter. He was born in London, and studied at the R.A. schools. Beginning to exhibit at the R.A. in 1854, he became associated with the pre-Raphaelite movement, and took part with Rossetti and his companions in the decoration with frescoes of the Oxford Union, 1858. He had already produced his *Ophelia*, *Eve of St. Agnes*, and *April Love*,

graceful and tender subject pictures in oils; but his reputation rests mainly on his water-colour work, and more especially on his black-and-white illustrations, *e.g.* to Tom Brown's *Schooldays*, 1869, and drawings for *Good Words*. He died Dec. 22, 1915.

Hughes, CHARLES EVANS (1862-1948). American politician and jurist. Born in Glens Falls, New York, April 11, 1862, son of a Baptist minister from Wales, he studied at Colgate and Brown universities, and took a degree in law at Columbia in 1884. He began practising in New York. During 1891-95 he occupied chairs in law at Cornell university, was legal adviser to various commercial undertakings, and in 1906 was employed by the attorney-general in the coal investigation. Ruthless exposure of insurance scandals won him the governorship of New York, 1907-10. Then he became a judge of the supreme court. In the presidential election of 1916 Hughes was the Republican selected to oppose Wilson, but was beaten by 23 electoral votes. During 1921-25 he was secretary of state. Judge at the permanent court of international arbitration at The Hague, 1928, he went back to the U.S. supreme court as chief justice, 1930-41. He died Aug. 28, 1948.

Hughes, DAVID EDWARD (1831-1900). Anglo-American inventor. Born in London, May 16, 1831, he went to America when a child, and in 1850 became professor of music at Bardstown College, Ky. In 1855 Hughes patented the printing telegraph which bears his name; and the companies formed to work this instrument were the nucleus of the Western Union Telegraph Co.

The Hughes system was adopted in France in 1861; in England and Italy in 1862; and in most other European countries between 1864 and 1876. In 1878 Hughes communicated to the Royal Society his invention of the microphone (*q.v.*), and next year that of the induction balance. In 1881 he was elected president of the Institution of Electrical Engineers. He died Jan. 22, 1900. *See* *Telegraph*.

Hughes, HUGH PRICE (1847-1902). Welsh preacher. He was born at Carmarthen, Feb. 8, 1847, the son of a doctor. He was intended for the law, but decided to enter the Wesleyan ministry, for which he was trained at Richmond theological college; he also studied at London university. He was successful as an ordinary minister, in Dover, Brighton, and

Oxford, while he became known to a wider public as superintendent of the wealthy London circuit of Brixton Hill. In 1887 he started the West London Mission, attracting large audiences to his services at S. James's Hall, which were intended for those outside the ordinary churches. In 1898 he was president of the Wesleyan Conference. Hughes edited *The Methodist Times*, which he founded in 1885, until his death from overwork, Nov. 17, 1902.

A great believer in unity among nonconformists, yet not without a liking for ceremonial, he was president of the Free Church Council, in the inception of which he took a prominent part. *Consult* *Life*, D. P. Hughes, 1904.

Hughes, RICHARD ARTHUR WARREN (b. 1900). A Welsh author. Educated at Charterhouse

Richard Hughes,
Welsh author

and Oriel College, Oxford, he saw his first play, *The Sisters' Tragedy*, produced in London in 1922, and *A Comedy of Good and Evil* in 1925. These two, with *Danger*, and *The Man Born to be Hanged*, were published together in 1924. *A High Wind in Jamaica*, an unusual story of children and pirates, appeared in 1929; *In Hazard*, the story of a ship in a typhoon, in 1938. Until 1936 vice-chairman of the Welsh National Theatre, Hughes claimed that *Danger* was the world's first radio play.

Hughes, SIR SAMUEL (1853-1921). Canadian politician. Born at Darlington, Ont., Jan. 8, 1853, he was educated at Toronto university, becoming a school teacher and later a journalist. In 1892 he entered the dominion parliament as Conservative member for Ontario, and in 1897 made a tour of the British Empire to advocate closer imperial defence. Minister of defence in the Borden government, 1911-14, he organized the Canadian forces at the outbreak of the First Great War and himself came to Europe. In Nov., 1916, he resigned from the cabinet owing to differences with his colleagues, but retained his seat in parliament. Knighted in 1915, he died Aug. 24, 1921.

Hughes, SPENCER LEIGH (1858-1920). An English journalist and politician. He was born at Trowbridge, April 21, 1858, went to

Woodhouse Grove School, near Leeds, and worked for the engineering firm of Ransomes, Ipswich. He joined *The Star* in 1891, and was lobby and gallery representative of *The Morning Leader*, in which he wrote the Sub Rosa column, continued for some time in *The Daily News* after its amalgamation with *The Morning Leader*, 1912. Hughes sat as Liberal M.P. for Stockport from Jan., 1910, until his death, Feb. 22, 1920.

Hughes, THOMAS (1822-96). A British author. Born at Uffington, Berks, Oct. 20, 1822, he was the

Thomas Hughes,
British author

son of John Hughes, editor of *The Boscobel Tracts*. Educated at Rugby under Arnold, he went to Oriel College, Oxford. In 1848 he became a barrister and

in 1869 was made a Q.C. He entered parliament as Liberal M.P. for Lambeth in 1865, and sat for Frome 1868-74. In 1882 he was made a county court judge, his circuit being around Chester. He died at Brighton, March 22, 1896. Hughes is famous for *Tom Brown's Schooldays* (q.v.), published 1857, a story of life at Rugby in the author's time. Its vividness and geniality set for school stories a standard no other writer has surpassed. Hughes was a Christian Socialist and an advocate of greater liberty and comfort for the working classes. He succeeded his friend F. D. Maurice as principal of the Working Men's College, London; another close friend was Kingsley. His other books include *The Scouring of the White Horse*, 1858; *Tom Brown at Oxford*, 1861.

Hughes, WILLIAM MORRIS (b. 1864). Australian statesman. A Welshman, born Sept. 25, 1864, the son of a carpenter, he was educated at Llandudno grammar school. In 1884 he went to Australia, where he spent some time as a sheep-drover and in other outdoor occupations in Queensland and New S. Wales, before settling in Sydney in 1890. During a great strike among the waterside workers he organized the wharf labourers of Sydney into a powerful union, of which he became general secretary. In 1894 Hughes was returned as Labour M.P. to the N.S.W. legislature and remained therein until the formation of the Commonwealth in 1901.

In that year Hughes was elected Labour member for W. Sydney. In the first labour government of Australia, 1904, he became minister for external affairs. Having served with various governments as attorney-general, in Oct., 1915, he became prime minister in succession to Andrew Fisher, whose chief lieutenant he had long been, retaining also his legal post. In 1915 and 1916 he visited England, and in 1918 attended the peace conference in Paris. Although often in difficulties, Hughes continued in power until Feb. 2, 1923. From 1919 he was an English K.C. He entered the cabinet again as vice-president of the executive council under Lyons in 1934; held several offices in the coalition government; and became deputy leader of the opposition in 1941, when he was made C.H. Some of his speeches and writings were collected as *The Case for Labour*.

Hugo, VICTOR MARIE (1802-85). French poet, playwright, and author, born at Besançon, Feb. 26, 1802. His father's family came from Lorraine; his mother was of Breton stock. The father became an army general and, having attached himself to Joseph Bonaparte, took his family when he accompanied that monarch to Madrid, of which city he was made governor. Here Victor attended the college of nobles, where the prevailing aristocratic environment was to have a profound result in his later demagogic tendencies.

Under the Bourbons he lived with his mother in Paris, where, at the Pension Cordier, he received his only regular education. After her death in 1821 he lived in

Victor Hugo

From the painting by Bonnat

penury. In 1816 he had begun to write, boasting "I wish to be Chateaubriand or nothing." Volumes of verse appeared in rapid succession: *Odes et Poésies Diverses*, 1822; *Nouvelles Odes*, 1824; *Odes et Ballades*, 1826; and his first stories, *Han d'Islande*, 1823, and *Bug-Jargal*, 1826. Written to please the court, these works were classical in form and royalist in sentiment. Their author received a pension of 1,000 francs from Louis XVIII, and in 1825 was created chevalier of the legion of honour.

Leader of French Romanticism

His sentiments became increasingly republican, e.g. in the dramas *Cromwell*, 1827 (its preface was a "romantic" manifesto), *Marion Delorme*, 1829, and *Hernani*, 1830. This last established his claim to be the high priest of French romanticism, a position he occupied for some 50 years as he poured out plays, novels, and poems. Hugo considered himself one of the leaders of humanity. He was intensely personal in his writings. *Le Dernier Jour d'un Condamné*, 1829, and much of his epic novel *Les Misérables* (q.v.) prove him to have been sincerely humanitarian.

The popular medieval romance, *Notre Dame de Paris*, and the brilliant verses, *Feuilles d'Automne*, appeared in 1831; *Les Chants du Crépuscule*, 1835; *Les Voix Intérieures*, 1837; the drama *Ruy Blas*, 1838. At the height of his powers, Hugo in 1841 secured election to the Academy. The following year appeared *Les Burgraves*, his last acted play.

Created a peer by Louis Philippe in 1845, Hugo entered the political arena. The revolution of 1848 suppressed the house of peers, but he was elected to the new assembly under the Second Republic. Events made the poet-politician the symbol of progressive republicanism. The *coup d'état* of Napoleon III in 1851 deprived him of his position and he escaped to Brussels; his account of the affair, *L'Histoire d'un Crime*, was published in 1877. In 1852 he went to Jersey, where the *Journal de l'Exil* was begun, and *Les Châtiments*, invective in verse, completed. Expelled in 1856, he went to Guernsey. The success of *Les Contemplations* enabled him to purchase Hauteville House, henceforth his home. Famous works belong to this period, e.g. the first series of *La Légende des Siècles*; *Les Chansons des Rues et des Bois*;

Les Travailleurs de la Mer (trans. into Eng. as *Toilers of the Sea*), *L'Homme qui Rit*. But this period of exile was unhappy. Deserted by his family, Hugo found himself in a backwater, though Juliette Drouet, an actress with whom he had long ago formed a liaison, remained faithful until her death in 1883.

After the Franco-Prussian War Hugo returned in triumph to Paris. Later works include *L'Année Terrible*, 1872, which recorded the tragic events of the Paris siege, 1870-71. *Quatre-Vingt-Treize*, his last novel, appeared in 1874. Elected senator in 1878, he published *Acts et Paroles* in 3 volumes. His last years brought *Les Quatre Vents de l'Esprit*, and a drama, *Torquemada*. He died May 22, 1885, and was buried in the Panthéon.

Of Hugo's dozen plays, *Hernani*, *Ruy Blas*, *Marion Delorme*, and *Le Roi S'Amuse* are still remembered; of his novels, *Notre Dame de Paris*, *Les Misérables*, and *Les Travailleurs de la Mer* have a permanent place in literature. For energy and fertility he is not easily paralleled among writers. Inevitably much of his writing lacks depth and creative force. But he occupies an exalted position as one of the finest lyric poets, and the French agree that in this sphere principally he still merits the reputation he achieved during his career.

Bibliography. Works, National Ed., 44 vols., 1885-95; Collection Nelson, 51 vols., 1910; Life, F. T. Marzials, 1888; Victor Hugo; M. Benedek, 1912; V. H., the Man and the Poet, W. F. Giese, 1927; The Tragic Life of V. H., L. Daudet, new ed., 1945; The Career of V. H., E. M. Grant, 1945. Saintsbury's History of the French Novel should also be consulted.

Huguenots. Name given to the French Protestants, who adopted the Calvinistic form of the reformed religion. As in Scotland, the antagonism between the crown and the nobles, coupled with the monarchy's adherence to the R.C. faith, led many nobles to place themselves at the head of the Reformation movement. The Huguenots multiplied also among the humbler classes, especially in the industrial towns, while most of the north, and especially Paris, remained fervently Catholic. Under Francis I and Henry II, heresy was persecuted, but the nobles were too strong to be suppressed. In the reign of Charles IX there was a series of wars of religion. In spite of the

Massacre of S. Bartholomew the Huguenots were not crushed, and on the death of Henry III their leader made good the claim to the crown as Henry IV, but only by professing himself a Catholic.

By the Edict of Nantes, 1598, however, freedom of conscience was secured to the Huguenots, together with peculiar privileges in a number of centres. During the minority of Louis XIII there was some revival of persecution. When Richelieu came into power, 1620, he pursued Henry IV's policy of toleration, but the Huguenot nobles made religion a pretext for opposition to the growing power of the crown and the restriction of their own independence. Huguenot risings were put down, but the Huguenots were still not deprived of reasonable rights or privileges.

Throughout the reign of Louis XIII (d. 1643) they were active as a political faction rather than as a religious body. Louis XIV, however, after twenty years of personal rule, reverted, under the influence of Madame de Maintenon, to the policy of persecuting heresy; the Huguenots were subjected to the horrors of the *dragonnades* (q.v.), and in 1685 the Edict of Nantes was revoked. The result, in spite of the severest measures, was the flight of vast numbers of the best of France's industrial population, who took refuge in England, Holland, Brandenburg, and elsewhere. See France: History; Protestantism; Reformation; S. Bartholomew, Massacre of.

Huia (*Heteralocha acutirostris*). Bird of the crow family found in the forests of New Zealand, where it nests in hollow trees. The plumage is a glossy, greenish black, the tail tipped with white, and the large rounded wattles are orange-red. The remarkable feature of this bird is that the ivory-coloured beak of the male is short, straight and stout, while that of the female is long, curved, and slender. The birds work in pairs for their favourite food, the grub of a timber-boring beetle, the differing beaks enabling the birds to reach the grubs in decayed or hard woods. The huia is specially protected by the New Zealand government.

Huichols (healers). American-Indian tribe of Piman stock in the mountains of Jalisco, Mexico. Mingled with their primitive customs are Aztec and Christian elements. Their ceremonial life is exacting, there being 18 god-houses and several sacred caves. See American Indians.

Huila. Department of Central Colombia, S. America. Between the Central and S.E. Cordilleras, it is watered by the Magdalena river. Cattle are reared. The principal products are cacao, rice, sugar, coffee, and tobacco. The capital is Neiva (q.v.). The vapour-emitting volcano called Huila is in the Colombian Andes, about 60 m. N.E. of Popayán. The department shows remains of a once important ancient civilization. The area is 7,996 sq. m. Pop. 216,876.

Huitzilopochtli. Principal god of the Aztecs of ancient Mexico; the god of war, also possessing power over crops. Wholesale human sacrifices were made on his altar. At one of his festivals grain and other seeds mixed with honey and the blood of children was formed into an image of the god, and later sacrificed, broken into small pieces, and eaten by the people. He was generally represented carrying spears and a shield, and wearing a plume of humming-bird feathers. See Aztec.

Hulaku Khan (d. 1265). Mongol king. Grandson of Jenghiz Khan, in 1253 he was appointed by his brother, Mangu Khan, governor of the W. portion of the Mongol empire, which included Persia, Georgia, Armenia, and the greater part of Asia Minor. Putting an end to the Assassin dynasty in 1255, he advanced on Bagdad and deposed the caliph in 1258, imposing his rule on Syria and Mesopotamia. In Persia he founded the Ilkhan dynasty at Azerbaijan and, on the death of his brother, proclaimed his own independence. See Mongol.

Hulbert, JACK (b. 1892). British comedian. Born April 24, 1892, and educated at Westminster and Caius College, Cambridge, he made his mark in university revues. One of these being produced at the Queen's Theatre, London, in 1913, Hulbert caught the eye of Robert Courtneidge, and was given a part in *The Pearl Girl*. Thence, except for a period of army service, he appeared with uninterrupted success in musical shows until 1931, including *Clowns in Clover*, 1927, in which he played opposite his wife Cicely Courtneidge. He made a feature of acrobatic and comedy dancing. In films, 1931-38, he appeared in *Sunshine Susie* and *The Ghost Train*, and was the star of Jack's the Boy, *Bulldog Jack*, etc. He returned to the West End stage in *Under Your Hat*, 1938. In 1941 he toured with his brother Claude in Hulbert's Follies.

Claude Noel Hulbert (b. 1900) was a comedian who, in contrast to

Jack's breezy elegance, obtained his laughs from a diffident, apologetic manner, and was perhaps most successful as a broadcaster. Born Dec. 25, 1900, he was educated at King's College, Chatham, and Caius College, Cambridge, and made his London debut in *Fantasia* at the Queen's Theatre, 1921. He played in musical shows until 1930, specialising in comedy dancing, and then concentrated on film and radio work. He married the actress Enid Trevor. The Hulbert family—Jack, Cicely, Claude, and Enid—were long a popular B.B.C. feature.

Hull. River of Yorkshire (East Riding), England. It rises on the wolds near Great Driffield, and follows a winding, but generally southerly, course of 23 m., discharging into the Humber after passing through the city of Kingston-upon-Hull, better known as Hull (*v.i.*).

Hull. City, seaport, co. and mun. borough of the E. Riding of Yorkshire, England. Properly called Kingston-upon-Hull, it stands where the river Hull falls into the Humber, 20 m. from the North Sea and 175 m. N. of London. In the N.E. rly. region, it has bus and trolley bus services and a ferry across the Humber to New Holland.

The church of Holy Trinity, partly 13th century, has a Perpendicular nave and a massive central tower; the city hall and exchange are modern buildings in the Italian style. Other buildings are the Guildhall, Law Courts, Corn Exchange, Chamber of Commerce, and Custom House. Hymers College is a public school, and there are an old grammar school, technical colleges, and a school of art; Wilberforce Museum occupies the house in which the emancipator of slaves was born. The city has an art gallery and two museums. The Charterhouse was founded in 1384, and Trinity House, a seamen's home, is another old foundation. There are three parks and a botanical garden. Beverley racecourse is in the vicinity. The old city lies between the modern docks and the river Hull. Pop. est. 287,380.

The harbour lies along the river Hull. Around it and along the N. side of the Humber are modern docks, belonging to British Railways, covering about 200

acres. Connected with them are extensive timber yards. King George V dock, the newest, is the largest on the E. coast of England outside London. The headquarters of the Ellerman-Wilson shipping line, Hull is the premier fishing port of the U.K. and the largest centre of seed crushing and oil extracting in the world. It has an important flour milling industry, and manufactures chemicals, cement, paper, paint, soap, starch, shoes, mill machinery, rope, and fish- and vegetable-oil products.

The city is administered by a lord mayor and corporation. The latter maintains public libraries, baths, etc. The port is administered in conjunction with Goole. Hull, represented in parliament since 1295, sends four members to the commons, one of its constituencies including Haltemprice, and has a suffragan bishop.

Originally known as Wyke-upon-Hull, it stood on land belonging to a religious order, but Edward I bought it and changed its name to Kingston. It received its first charter from him in 1299. Walls were built, and the inhabitants were granted privileges, among them the right to choose a mayor and to be a county with a sheriff. As the volume of shipping increased, accommodation was provided along the river Hull. At the opening of the Civil War the Hothams held the town for parliament, and it was besieged in 1643 and 1644.

Hull's modern prosperity began with the industrial revolution. The first modern dock was constructed in 1774, and in the 19th century others were built and enlarged. In 1888 the town became a co. bor.

Hull was a target for German aircraft in the First Great War, and in the Second they attacked it heavily and repeatedly. Be-

tween Sept., 1939, and March, 1945, it suffered 82 air raids, in which 83,000 out of its 92,660 houses were destroyed or damaged, and 120,000 people rendered homeless. The killed and missing numbered 1,302; those seriously injured, 1,141. The city centre required almost complete rebuilding, and a plan was devised by Sir Patrick Abercrombie and Sir Edwin Lutyens.

Hull. City of Quebec, Canada. It stands on the Ottawa river, just where the Gatineau falls into it, and opposite the city of Ottawa. Three bridges connect the two. Hull lies 119 m. W. of Montreal, and is served by the C.P.R., while there is an electric rly. across to Ottawa and to Aylmer. The city is the centre of the lumber industry, and its industries include sawmills and the manufacture of wooden goods, such as furniture and matches; also paper, cement, biscuits, bricks, etc. It is the capital of Ottawa county. Hull was devastated by a fire in 1900. Because of its position the spot was a stopping place for Indians and traders. It was settled soon after 1800, and became a city in 1875. Pop. est. 35,050.

Hull, CORDELL (b. 1871). American statesman. Born in a log cabin in Tennessee, Oct. 2,

1871, and educated at Columbia university law school, he was a barrister at 20 and a circuit judge at 30. Democrat member of congress in 1907, except for the period 1921-23 he sat

Cordell Hull,
U.S.A. statesman

continually until 1931, when he was elected to the senate. In 1933 he resigned to become secretary of state in F. D. Roosevelt's administration, an office he held until ill-health forced him to resign in 1944. Hull was chairman of an American delegation to the London economic conference in 1933, and headed

Hull, Yorks. Building housing the School of Art in this city of the East Riding

another delegation to the inter-American conference for the maintenance of peace, at Buenos Aires in 1936. With Roosevelt he inaugurated the "good neighbour" policy towards S. American states. Opposed to tariffs, he was an expert on taxation, and wrote the first American federal income-tax law. During the Second Great War he was criticised for his attitude towards France after the setting up of the Pétain regime, though events appeared to justify his policy when Darlan supported the Allies in N. Africa. Hull accompanied Roosevelt to the Quebec conference and took part in the foreign ministers' conference in Moscow. A delegate to the San Francisco conference in 1945, he was awarded the Nobel peace prize for that year. His *Memoirs* were published in two vols in 1948.

Hull, Henry Charles (1860-1932). South African politician. Born, Nov. 21, 1860, at Caledon, he became a solicitor. For his share in the Jameson Raid he was sentenced in 1896 to two years' imprisonment and a fine of £2,000. In the S. African War he served in the Light Horse. An associate of Botha, he became treasurer of the Transvaal, and in 1910, when the Union of S. Africa was formed, he entered its cabinet as minister of finance. In 1911 dissensions broke out, and in 1912 Hull resigned on a disagreement over railway policy. He died on Oct. 9, 1932.

Hull, William (1753-1825). An American soldier. Born at Derby, Conn., June 24, 1753, he became a lawyer in 1775. On the outbreak of the War of Independence he became a soldier, and rose to be lieut.-colonel. When the U.S.A. secured its independence, he became head of the militia of Massachusetts, and a member of the senate. Later he was governor of the territory of Michigan. When, in 1812, war broke out between Great Britain and the U.S.A., Hull invaded Canada in command of an army, but soon fell back, and, shut up in Detroit, surrendered to the British. He was tried by court-martial and sentenced to death, but the sentence was not carried out. Hull died Nov. 29, 1825.

William Hull,
American soldier

Hullah, John Pyke (1812-84). An English composer. Born at Worcester, June 27, 1812, he studied at the Royal Academy of Music, and in 1836 produced his first large work, an operetta, *The Village Coquettes*, to a libretto by Dickens. Several of his ballad tunes are remembered, e.g. *The Sands of Dee*, *The Three Fishers*. Professor of vocal music at King's College, London, 1844-74, he upheld the system of a fixed Do against the tonic sol-fa. He died Feb. 21, 1884.

Hull House. The pioneer American social settlement. It was founded in Chicago in 1889 by Jane Addams (*q.v.*). She acquired an old country mansion, once owned by Charles J. Hull, in the centre of a district packed with immigrant victims of the sweating system. Assailed in the Chicago press as a breeding place of anarchists, it lived down this accusation and became generally recognized as a model example of co-operation in social advancement.

Hulse, John (1708-90). English clergyman. Born at Middlewich, Cheshire, March 15, 1708, he was educated at S. John's College, Cambridge. After working for some years as a clergyman, he in 1753 inherited his father's estates in Cheshire and retired into private life. At his death, Dec. 14, 1790, he left his property to the university of Cambridge to found two divinity scholarships at S. John's of £30 a year each; to provide a prize—now called the Hulsean prize—for a dissertation on Christian evidences; to endow a new office of Christian advocate—now the Hulsean professor of divinity; and to endow a lectureship (*v.s.*).

Hulsean Lectures. Lectures delivered at Cambridge university in connexion with a bequest of the Rev. John Hulse (*v.s.*). He left to the university some land in Cheshire, which now produces about £1,200 a year. The fund provides for a preacher, a professor, a lecturer on some branch of Christian theology, and a prize, which is worth about £110. The first lecture was delivered by Christopher Benson (1789-1868) in 1820.

Hulton, Sir Edward (1869-1925). A British newspaper proprietor. He became the head of Hulton & Co., Ltd., publishing a group of successful newspapers in Manchester, including the *Daily Dispatch*, *Sunday Chronicle*, and *Empire News* (now *Sunday Empire News*). He also founded two London papers, the *Daily Sketch* (now *Daily Graphic*), 1909

(London publication, 1911), and the *Illustrated Sunday Herald* (now *Sunday Graphic*), 1915; and from 1915 to 1923 held the controlling interest in the *Evening Standard*, London. The Manchester papers were the original basis of what was formed in 1924 as *Allied Newspapers, Ltd.*, and later became *Kemsley Newspapers*. Hulton, who was well known as a patron of the turf, was created a baronet in 1921, and died May 23, 1925. (See *Camrose*; *Kemsley*.)

His son, Edward George Warris (b. 1906), founded his own company to publish *Picture Post*, 1938. He later acquired *Housewife*, *Lilliput*, *The Leader*, and other periodicals.

Humane Society, The Royal. Society for rendering first aid in cases of drowning and for restoring life to the apparently drowned or dead. It was instituted in England in 1774 at the instance of Dr. William Hawes (1736-1808) and Dr. Thomas Cogan (1736-1818). The first life-saving depot was the Receiving House, built on the bank of the Serpentine in 1794 on a site given by George III; it was damaged by bomb blast in 1940.

The society makes awards of medals, testimonials, and sums

Royal Humane Society's medal,
awarded for gallantry in saving life

of money for gallantry in saving or attempting to save life from drowning and from asphyxiation in mines, wells, sewers, and similar places. In 1946, 506 persons were rewarded by the Society for saving or attempting to save 471 lives. It gives prizes for swimming to schools and training ships. In 1873 the Stanhope gold medal was instituted, to be awarded annually for the act of greatest gallantry during the preceding year. The offices are at Watergate House, York Buildings, London, W.C.2.

Humanised Milk. Cow's milk made, as far as possible, to resemble in composition human milk. Several processes are adopted by manufacturers, but all dilute cow's milk so as to reduce the proportion of protein, and add cream and sugar. See *Diet*; *Milk*.

Humanism. Name given to a phase of the intellectual movement marking the Renaissance (*q.v.*). The medieval outlook upon life, with its hard and fast rules of conduct, had stifled the moral and intellectual development of the individual. In revolt against scholasticism and clerical predominance, humanism looked for an ideal system of culture—the Ciceronian *humanitas*, whose name lingers in the Scottish school of humanity and the Oxford *litterae humaniores*—and found it in the revival of classical learning. It embraces the period from Petrarch (1304–74) to Melancthon (1497–1560).

As used by modern philosophers, humanism is applied to almost any system of thought that places man and human affairs in its centre, disregarding, in particular, abstract and supernatural phenomena. Pragmatism or empiricism is one form of humanism; scientific humanism is another, perhaps more extreme. Humanist philosophers include such diverse personalities as John Dewey and Gilbert Murray, Paul Elmer More and Julian Huxley. See Philosophy; Pragmatism.

Humanitarian. Term used in a general sense for people who seek the physical welfare of their fellows. The term has also been used in a more restricted sense. About the middle of the 18th century a school of thought arose which denied the divinity of Christ and virtually adopted the position of modern Unitarians, its followers being known as Humanitarians. Another sect was started by Pierre Leroux (1798–1871), who held that human nature was of itself capable of reaching perfection.

Human Rights, DECLARATION OF. International bill drawn up and adopted by the United

Nations, Dec. 10, 1948, after 2½ years of study by a U.N. commission under the chairmanship of Mrs. Eleanor Roosevelt. In 31 articles it stated the fundamental minimum rights of every human being. Human rights clauses were written into the peace treaties signed in 1947 between the Allies and Axis satellites; in April, 1949, the U.K. and the U.S.A. charged Bulgaria, Hungary, and Rumania with the violation of these clauses, and in 1950 announced their intention of bringing the matter before the international court of justice.

Humayun (1508–56). Mogul emperor. Coming to the throne of Delhi in 1530 as the son of Babar (*q.v.*), he was immediately plunged into war with the Afghans, and in 1540 was forced to retire to Persia. His campaign against the Afghan Sher Shah in 1555 was successful, and he was able to take possession once again of Delhi (*q.v.*). The following year he had a fatal fall in his palace. He was succeeded by his son Akbar (*q.v.*).

Humber. Estuary on the E. coast of England, formed by the rivers Ouse and Trent. Its length is 37 m., breadth from 1 m. to 8 m., and drainage area 9,300 sq. m. The entrance is partly enclosed on the N. by the Spurn Head peninsula. Grimsby is situated on the S. shore near the entrance, Hull about midway along the N. shore, and Goole at the head of the estuary.

In 1937 archaeologists dug up two primitive boats from the mud at North Ferriby, near Brough. Estimated to be 2,500 years old, the boats were 45 ft. long and 4 ft. wide; unlike other primitive craft, they were carved-built, of oak framework covered with planking sewn with yew withies.

Humbert I OR UMBERTO I (1844–1900). King of Italy. Born at Turin, March 14, 1844,

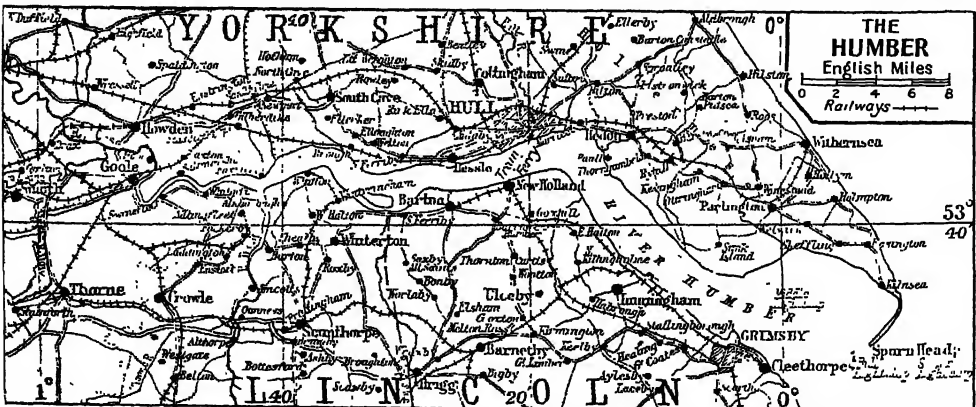

Humbert I,
King of Italy

he was the eldest son of Victor Emmanuel II and Maria Adelaide, arch-duchess of Austria. He commanded the 16th division at the battle of Custoza, 1866. In 1868 he married his cousin, Princess Margherita of Savoy (d. 1926). On Jan. 9, 1878, Humbert succeeded to the throne. The great popularity which he earned by bravery and deeds of kindness waned, and on July 29, 1900, he was assassinated at Monza by an anarchist, Bresci. His successor was his only son, Victor Emmanuel III (*q.v.*).

Humbert II OR UMBERTO II (b. 1904). Last king of Italy. Born Sept. 15, 1904, the son of Victor Emmanuel III, he was educated at the royal military academy, Turin. In 1930, as prince of Piedmont, he married Princess Marie José of Belgium. Ten years later he was in command of Italy's army of the Alps, with the rank of general. On June 5, 1944, he was designated lieutenant-general of the realm, taking over all royal powers. Following the abdication of Victor Emmanuel on May 9, 1946, he was proclaimed king; but, the referendum in June giving a majority for a republic, left for Portugal, June 13.

Humble Bee OR BUMBLE BEE (*Bombus*). Insects of the order Hymenoptera, with densely hairy bodies usually banded with white, yellow, or reddish orange. They are social in habit. In the tropics

Humber. Map of the estuary formed by the rivers Ouse and Trent on the east coast of England

they are chiefly confined to mountains; they are absent from the plains of India and from most of Africa, while only introduced species occur in Australia and New Zealand. In temperate regions the colonies perish in autumn, but some females hibernate and reappear in spring to found new societies.

Workers are the most abundant caste and are usually only clearly separable from the queens or females by their smaller size. The nests are made either below ground or on the surface among close herbage. The cells are of wax, rounded and in irregular groups, very unlike the comb of the hive bee. The honey is pleasant to taste. The tongue of a humble bee is much longer than that of a hive bee, enabling it to extract nectar from long tubular flowers such as clover, nasturtium, or foxglove.

In addition to the humble bees that form the genus *Bombus*, there are parasitic species (genus *Psithyrus*) that live in the nests and at the expense of the *Bombus* brood. *Psithyrus* produces no workers, its males and females being reared by the *Bombus* workers. Nineteen species of *Bombus* and six of *Psithyrus* occur in Great Britain. Consult *The Humble Bee*, 1912, F. W. L. Sladen.

Humble Petition and Advice. Second written constitution given to England during the Commonwealth, the Instrument of Government being the first. In 1657 the Instrument had proved a failure, the establishment of the major generals had caused much discontent, and the Commonwealth was in danger. In these circumstances parliament met and discussed the Humble Petition.

Cromwell was offered the position of king, and was authorised to call together a house of lords. He was allowed to name his successor, and given command of the army and navy. The petition was framed to prevent undesirable persons from sitting in parliament or on the council. Cromwell refused the title of king, and thus amended the petition was passed on March 25, 1657. A little later it was altered somewhat by the Additional Petition and Advice, the result being, as S. R. Gardiner says, "to enlarge the power of parliament and to diminish that of the council." See Cromwell, Oliver; Instrument of Government.

Humboldt. River of Nevada, U.S.A. Rising in the N.E. of the state, it flows 350 m. W. and S.W. to Humboldt lake, or sink, in

Churchill co. The river formerly overflowed into Carson lake, but its waters are now arrested by a dam. It is unnavigable, and its waters are salty. In its upper reaches and also in the lake district, near its former mouth, there are projects for irrigation works. The Humboldt cuts gorges in the N.-S. mountain ranges, and its valley provides the only E.-W. passage through the Nevada Mts. The Southern and Union Pacific rlys. follow the river along the route taken by many of the "Forty-Niners" on their way to the California goldfields.

Humboldt, FRIEDRICH HEINRICH ALEXANDER, BARON VON (1769-1859). German scientist.

Baron von Humboldt, German scientist
After Carl Begas

Born in Berlin, Sept. 14, 1769, of noble family, he studied science, and in 1790 travelled through France, the Netherlands, and England. In 1792 he was made assessor of mines. In 1799 he sailed with Bonpland (q.v.) to Venezuela, and made extensive explorations in the regions of the Orinoco and the Amazon. In 1802 he ascended Chimborazo to the height of 19,000 ft., travelling thence to Peru and on to Mexico, returning to Europe in 1804. Later he took up his residence in Paris, and published in great detail the results of his travels in 30 volumes. In 1827 he moved to Berlin, whence, at the invitation of the Tsar Nicholas, he made an expedition beyond the Ural and Altai mountains, 1829.

His great literary work, *Kosmos*, an encyclopedic account of the physical universe, which he began at 76, was published in four volumes between 1845 and 1858, and won him a world-wide reputation. It was a reconciliation of 18th century idealism with 19th century research. Humboldt suggested the igneous origin of rocks, made a study of terrestrial magnetism and of plant distribution, and left his mark on many branches of science. He died May 6, 1859.

Humboldt, KARL WILHELM VON (1767-1835). German scholar. Born at Potsdam, June 22, 1767, he was the elder brother of the above. He was educated at Berlin and Göttingen and entered the public service of Prussia, but spent much time travelling and in

study. In 1802 he was sent to Rome as minister, but he was soon at home again as minister of public instruction. He was employed in diplomatic work during the eventful

K. W. von Humboldt, German scholar
After F. Krüger

years 1810-19, being minister at Vienna and taking part in conferences in Paris, London, Aix-la-Chapelle, and elsewhere. Thereafter he devoted himself to literature. He began with an essay on Goethe's Hermann and Dorothea. Other works were translations of the Greek and Latin poets. As a philologist Humboldt really made his name. He devoted special attention to the Basque language, and began a book on that of the Kawi of Java, the introduction to which is regarded as a landmark in the study of philology. Humboldt was one of the founders of Berlin university. He died April 8, 1835.

Humboldt Current. Ocean current called after Baron Friedrich von Humboldt (q.v.), who first charted its course. It flows from the Antarctic along the W. coast of S. America to Punta Parina, Peru, where it alters course to the open sea. The space between the coast and the current is filled by cold water rising from the depths of the ocean, so that the W. coast of tropical S. America is washed by water at an average temperature of 60° F. Consequently these coastal areas are not tropical.

Hume, DAVID (1711-76). Scottish philosopher and historian. Born in Edinburgh, April 26, 1711, he was educated at its university.

Neither law nor business, which he successively essayed, proved congenial, and in 1734 he went to France to study philosophy with the Jesuits. In 1737 he appeared his first book, *A Treatise of Human Nature*, written from that standpoint of universal scepticism which was the basis of all Hume's philosophy. The book attracted little attention, but his *Essays*, *Moral*, *Social*, and *Political*, published in Edinburgh in 1741-42, were well received. After another period abroad as secretary to General

David Hume, Scottish philosopher and historian

St. Clair, in which capacity he visited Vienna and Turin, he settled in Edinburgh in 1752 as librarian to the Advocates' Library. Meanwhile he had published *An Enquiry Concerning the Principles of Morals*, 1751, in which he propounds a philosophy with a definite utilitarian note, and *Political Discourses*, 1751, which foreshadowed the free trade ideas of Adam Smith.

In 1754 was published the first part of a History of England, other parts following in 1756, 1759, and 1762. Inverting the usual practice, Hume began with the Stuart period and worked backwards to Roman Britain. The work has many faults and many merits. Hume had a temperamental bias against all popular institutions, which tends to make him an apologist for the Stuart monarchy. But he was the first to stress the social and intellectual condition of the people as essential elements in historical narrative. The work was a great success, but owing to the author's prejudices and inaccuracies it is useless to the student. In 1757 appeared the *Four Dissertations*.

In 1763 Hume went again to France, as secretary to the British ambassador, and stayed there three years. On returning to England he held an under-secretaryship at the Foreign Office, then from 1769 was in Edinburgh, where he died Aug. 25, 1776.

Two contributions were made by Hume to philosophical study. His defence of naturalistic ethics has remained unsurpassed even by J. S. Mill, and his critical examination of the notion of causation has never been satisfactorily refuted. Hume began where Berkeley had left off. In effect, he eliminated substance from mind. Impressions, he said, were the only things of which we had knowledge; we never had knowledge of mind. From this it follows that we cannot transcend our own impressions. Cause and effect are just a customary sequence of events. We are denied any faculty of abstraction: real knowledge, as Hume admits quite frankly, is apparently impossible. Applying his principles to ethics, Hume maintained that what is good is what is generally desired. His conclusions are the logical extreme of the empirical school and are based on the atomic view of psychology in that the mind is considered more as a passive receptacle of impressions than as an active and creative force.

Bibliography. Works, ed. T. H. Green and T. H. Grose, 4 vols..

1874; Letters, ed. J. Y. T. Greig, 2 vols., 1932; Lives, J. Hill Burton, 1846; C. J. W. Francke, 1907; J. Y. T. Greig, 1931; B. M. Laing, 1933; Monograph, T. H. Huxley, 1879; *The Forgotten Hume*, E. C. Mossner, 1943.

Humeral (Lat. *humerus*, shoulder). Veil or scarf worn over the shoulders by R.C. clergy. A sub-deacon wears it when holding the paten at High Mass; a priest when he raises the monstrance to give benediction with the Blessed Sacrament; and priests and deacons when removing the Blessed Sacrament from one place to another or carrying it in procession.

Humerus (Lat.). In anatomy, the upper arm bone. The superior extremity consists of a rounded head which articulates with the glenoid cavity of the shoulder blade and two tuberosities to which are attached muscles springing from the shoulder blade. The shaft gives attachments to the pectoral muscles coming from the front of the chest, and muscles which cause movements of the elbow. The inferior extremity has a projection on each side known as the condyle, for the attachment of muscles, and a smooth rounded part which articulates with the bones of the forearm. See *Anatomy*; *Arm*; *Man*.

Humidity (Lat. *humidus*, moist). State of the air considered with reference to the water vapour it contains. Wherever air, not already saturated with moisture, and water are in contact with each other, particles of water, in the form of vapour, pass into the air. When the air contains as much water vapour as it will hold, it is said to be saturated. The temperature corresponding to saturation by a known moisture content is described as the dew point temperature above 32° F., and as the hoar-frost point below 32° F. The higher the temperature of the air, the more the water vapour that can be held by a given volume of air; thus when saturated air is cooled, some of the water vapour condenses into liquid.

The heavy rainfall of equatorial regions is accounted for by the high temperature of the vapour-laden winds which are cooled in their forced ascent in the Doldrums low-pressure belt of calms. The feeling of wetness or dryness in the air is no indication of the amount of water vapour the air contains, as the presence of a certain amount of water vapour in air whose temperature is 40° F. may cause saturation, whilst the same amount at 70° F. may not be sufficient to give even a feeling of dampness.

In figures, 2.86 grains of moisture would saturate a cubic foot of air at 40° F., but would constitute only 36 p.c. of saturation were this air heated to 70° F. It has been asserted that the air of the Sahara normally contains more water vapour per cubic metre than that in England on a wet winter day, but it is not apparent on account of the high temperature.

The term absolute humidity is given to the actual weight of water present in a cubic foot, or metre, of air. The ratio of the absolute humidity to the weight of vapour which might exist if the same volume of air were saturated is called the relative humidity. The latter may also be expressed by the ratio:

$$\frac{\text{actual vapour pressure}}{\text{saturation vapour pressure at air temperature.}}$$

The relative humidity of the atmosphere exerts an influence on comfort, and is of primary importance in many industries. All systems of air conditioning, as distinct from ventilation, necessarily incorporate equipment for the automatic control of atmospheric humidity. Air should be dry enough to take up freely by evaporation the moisture continuously given off by perspiration and exhalation. It must also be sufficiently moist to do so imperceptibly, to avoid undue cooling of the skin and dryness of lips and throat.

The desirable ratio between the degrees of dryness and moistness, the optimum relative humidity, may vary with temperature and velocity of air movement between 50 to 70 p.c. without appreciable discomfort. In the U.K. the geographical location and the moistness of the ambient air combine to render 65° F. and a 60 p.c. r.h. the most comfortable condition. In the U.S.A. a temperature of 70° F. and a 50 p.c. r.h. are preferred because of the lesser overall moistness of the atmosphere. In both countries a lower r.h. would be fit for special conditions, e.g. in an hotel kitchen.

Many industries, notably wool spinning and film manufacture, require an r.h. between 80 and 90 p.c., together with dry-bulb temperatures of 75° F. to 80° F. In the final stages of tobacco curing, 100 p.c. r.h. in a temperature over 100° F. is necessary. A Factory Act prohibits the artificial humidification of certain rooms in textile factories when the wet-bulb reading exceeds 72.5° F., or when the wet-bulb depression is

HUMMING BIRDS LIVING JEWELS OF THE WESTERN HEMISPHERE

1. Typical small house, with thatched roof and a stork's nest on the chimney. 2. Girls in national costume, which is also their "Sunday best," assembling for morning service at their village church. 3. Peasants

at work in the fields. 4. Archbishop in pontificals. 5. Dance at a village fête. 6. Corner of a workman's home at Mézőkovész. 7. Horseman of the plains. 8. Country handwork at a street market in Budapest.

HUNGARY TYPES OF THE PEOPLE AND ASPECTS OF PEASANT LIFE

less than 2° F. Work must cease when the reading of the wet-bulb thermometer exceeds 80° F. See Hygrometer; Meteorology; Rain-fall.

J. W. Cowan

Humite. One of a group of minerals, comprising norbergite, chondrodite, humite, and clinohumite. They are all basic fluosilicates of magnesium; hydroxyl replaces part of the fluorine, and iron often takes the place of magnesium. These minerals commonly occur in Archæan metamorphosed dolomitic limestones. Common associated minerals include spinel, chrysolite, pyroxene, phlogopite, and magnetite.

Hummel, JOHANN NEPOMUK (1778-1837). Austrian musician, born at Pressburg, now Bratislava, Nov. 14, 1778. He learned the piano, and at the age of seven attracted the attention of Mozart, who installed him in his house as pupil. After touring Germany, Holland, and England, Hummel settled in Vienna, 1793, to study composition. He was Kapellmeister to Prince Esterhazy, 1804-11, and held similar posts in Stuttgart, 1816, and Weimar, from 1820. In 1833 he conducted German opera in London. As a pianist he ranked with Mozart and Beethoven, and he published a piano school which advocated new fingering methods; Czerny was among his pupils. Besides piano pieces, he wrote chamber music, songs, a mass, and two operas. He died Oct. 17, 1837.

Humming Bird. Large family of birds, Trochilidae. Mostly of small size, they are found chiefly in central and tropical S. America. They derive their name from the sound produced by the rapid vibration of their wings as they hover before a flower. There are about 500 known species, the smallest just over 2 ins. long and the largest 8½ ins. Usually the plumage is extremely brilliant and glistening. The effect is enhanced by the birds' crests, tufts, ruffs, and beards of feathers. Many have elongated and forked tails of elaborate character.

The sternum or breast-bone is highly developed and keeled to form an extensive base of attachment for the powerful muscles needed for the vibration of the wings. The beak is long and slender, and the long tongue is in the form of a double tube which can be extended to reach the bottom of deep flowers. The popular idea that humming birds live wholly on the nectar of flowers is erroneous, minute insects being

important in their diet. Zoologically they are more nearly related to the swifts than to any other family.

The small nest is constructed of moss, hair, and fine fibres, with an outer layer of leaves and lichens. It is placed on the slender branches of trees, its deep cup shape preventing the two eggs from being thrown out in a breeze. Some species are said to enlarge their nests as the young ones grow. Humming birds are not songsters, though most have call notes so high pitched and faint as to be almost inaudible.

The flight of some species consists of a series of erratic darts, varied by hovering and curious tumbling evolutions, made while the bird is catching insects in the air. The swiftness with which the bird darts about is such that the eye often fails to follow it. The birds live long in captivity only if most carefully kept with correct temperature, light, and diet. Some species have been found capable of resuscitation from complete coma induced by cold. It is thought that in nature they habitually survive in this state.

One of the most remarkable species is the racket-tailed humming bird, known only from the upper Amazon. It is extremely small, but is conspicuous for its jewelled crest and gorget and its wonderful tail. The second pair of tail feathers are wire-like and, after bending to form a loop, cross one another and end in purple expansions suggestive of a tennis racket. In the double-crested humming bird the general colour of the plumage is metallic green, and over the eyes are glittering tufts of purple, gold, and green. The throat is black and the under parts are pure white. It is found in a few places in Brazil.

The largest of the group, the great humming bird, is found in the Andes, and is about 8½ ins. long, with a wing spread of 5½ ins. It is not brilliant in colour, flies more deliberately than most other species, and expands and shuts its tail feathers fanwise when poised over a flower. See Bird; also colour plate facing p. 4360.

Humour. In literature and in general use, term applied so widely as to embrace all forms of the comical, funny, ludicrous, or diverting. Galen said that four humours, blood, choler, phlegm, and melancholy, lay at the base of the sanguine, bilious, phlegmatic, and melancholy dispositions of men, and that the perfect

man would have the four humours in equal proportion. The man of humour thus came to be one in whom any of these dispositions greatly preponderated over the others so as to give him a certain singularity. With a fitting pre-fatory adjective, the word is still thus applied.

Humour by itself, however, is always taken to indicate something with the elements of fun in it. With the 18th century humour began to be associated more especially with a new quality of tenderness, as exemplified in the writings of Addison, Steele, Goldsmith, Sterne, and others, and by the 19th century the use of the term had been extended to all manifestations of fun in literature and in action. Thackeray gave a high imprimatur to the wider comprehensiveness of the word by including in his survey of the English Humorists of the 18th century Jonathan Swift, whose qualities were rather those of satiric and sardonic wit than of humour.

Yet it is to Thackeray that we owe what are perhaps the best definitions of humour as exemplified in literature: "The humorous writer professes to awaken and direct your love, your pity, your kindness—your scorn for untruth, pretension, imposture—your tenderness for the weak, the poor, the oppressed, the unhappy"; and again, "A literary man of the humoristic turn is pretty sure to be of a philanthropic nature, to have a great sensibility, to be easily moved to pain or pleasure, keenly to appreciate the varieties of temper of people round about him, and sympathise in their laughter, love, amusement, tears—the best humour is that which is flavoured throughout with tenderness and kindness."

The term humour has in common use come to be applied to the work of all writers who seek to divert by means of raising smiles or laughter, whether by sympathetic understanding and presentation of idiosyncrasies, or by the cruder forms of ridicule and exaggeration. Humour is often confused with wit, but there are essential differences between them. As Leigh Hunt put it, "each is to be found in perfection apart from the other, yet their richest effect is produced by combination." See Wit.

Hump. Structure on the back of the camel, consisting of fatty tissue in which the animal can store nourishment which it consumes when short of food. The

hump probably does not play any significant part in enabling the animal to go without water. In the dromedary there is one hump; in the Bactrian camel there are two.

Hump, THE. Name given to the mt. barrier between Assam and China by airmen flying on the air supply route between those countries developed by the U.S. army during the Second Great War. When, in May, 1942, the Japanese overran Burma, thus closing the Burma Road to the Allies, it was decided to open two alternative lines of communication with China: the Ledo Road (*q.v.*) and an air route "over the Hump." U.S. engineers built large air bases in N. Assam—Chabua and Dinjan were two of many—as staging posts on a new direct air link with Yunnan. From small beginnings a greater volume of traffic eventually crossed the Himalayas by air than had used the Burma Road (20,000 tons a month in 1944, rising to 44,000 tons in Jan., 1945, compared with 18,000 tons). Technicians and warlike and medical stores were included in the loads, which were chiefly for the U.S. air forces stationed in China.

Hump-back Whale (*Megaptera nodosa*). Large cetacean found in most seas, and sometimes seen in summer off the coasts of Scotland and Ireland. It is black in colour, and attains a length of 50 ft. The back fin is mounted on a prominence, which gives the species its popular name. It is regularly hunted for its oil, which varies in amounts from 8 to 75 barrels per individual. See Whale.

Humperdinck, ENGELBERT (1854–1921). German composer. Born at Siegburg, Sept. 1, 1854, he

E. Humperdinck,
German composer

studied music at Cologne and Munich. Visiting Italy, he met Wagner, whom he assisted to produce Parsifal at Baireuth. In 1887, after teaching at Barcelona, he returned to Cologne, and in 1889 became a teacher in the conservatoire of music at Frankfurt. He moved in 1900 to Berlin, where he was head of the Meister Schule. Humperdinck's fairy opera, Händel and Gretel, 1893, was the cause of his sudden leap to fame. He wrote incidental music to The Miracle, 1911. For a time music critic to the Frankfurter Zeitung, he died Sept. 27, 1921.

Humphrey. Masculine Christian name. Of Teutonic origin, it means support of peace, and was popular in France and England in the Middle Ages. The phrase "dinner with Duke Humphrey" refers to the duke of Gloucester (*q.v.*), a brother of Henry V.

Humphrey Clinker. Novel by Tobias Smollett, published in the year of his death, 1771, as The Expedition of Humphrey Clinker. The nominal hero is the illegitimate son of the man into whose service he enters as a hobbledehoy of all work. Setting forth a sentimental journey through Britain, the book may well have been designed as a skit on the successful novels in letters of Richardson and the Sentimental Journey of Sterne. The most genially humorous of Smollett's works, it presents some ludicrous characters, and develops its story in a series of letters from a small group of correspondents. Tabitha Bramble, a forerunner of Mrs. Malaprop, and Winifred Jenkins, with her ridiculous misspellings, are notable.

Humphreys, SIR TRAVERS (b. 1867). British judge. Educated at Shrewsbury and Trinity Hall,

Hump-back Whale. A summer visitor to the Irish and Scottish coasts

Cambridge, he was called to the bar in 1889, and became counsel to the crown at the Middlesex sessions. Junior counsel at the C.C.C., 1908, and senior counsel, 1916, he became recorder of Chichester and, in 1926, of Cambridge. He was knighted in 1925, and in 1928 was appointed a judge of the king's bench division. In 1946 he became a privy councillor, and in that year published a light-hearted book of reminiscences, Criminal Days.

Humphry, OZIAS (1742–1810). English painter. Born at Honiton, Sept. 8, 1742, he studied art at the St. Martin's Lane academy, and then at Bath under Samuel Collins, whom he succeeded in his practice

as a miniaturist; but in 1763 he returned to London. He painted miniatures with great success until 1772, when a fall from his horse temporarily disabled him. In 1773 he went to Rome and in 1785 to India, where he executed oil portraits, resuming miniature painting on his return to England three years later. He had become A.R.A. in 1779, and in 1791 was elected R.A. Failing sight compelled him to abandon miniature in his last years, but he had taken up portraiture in crayons. Humphry died March 9, 1810.

Humus. Gelatinous product of decay of vegetable and animal material on and near the ground surface. The mixture of organically derived humus with mineral matter of rock-decomposition constitutes soil. Consult Humus and the Farmer, F. Sykes, 1946.

Hunan. Province in central China. Covering 79,378 sq. m., it has 74 counties and two municipalities, with Changsha as its capital. Other cities include Changteh and Hengchow. The Canton-Hankow rly. runs through the province from N. to S.; the Hunan-Kwangsi rly. extends W. to Kweilin, and the Hunan-Kweichow line W. to Kweiyang. In addition to being the country's largest rice-producing area, Hunan yields many minerals, including wolfram and antimony. Other products are tea, tung oil, and linen. S. of the Yangtze is Tungting Lake, the largest in the

country. Pop. 28,092,454.

During the Second Great War, in Sept., 1941, the Japanese launched an offensive southwards against Changsha, but were compelled to withdraw on Oct. 2. A fortnight later they captured Chenchow in S. Hunan, only to be driven out in Nov. In the last week of 1941 the Japanese initiated a heavy offensive in N. Hunan with the object of preventing Chiang Kai-shek from sending troops to aid the Allies in Burma; but the operations ended in defeat, costing the best part of four divisions. On Dec. 3, 1943, after 15 days' siege, in which fewer than 300 men defending the city survived, the Japanese took Changteh, but after six days were

driven out. In June, 1944, however, the Japanese succeeded in capturing Changsha, and pushed rapidly S. until they had secured control of the rly. line throughout the prov. In May, 1945, the Chinese 6th army, flown in over "the Hump" with guns, horses, and equipment by U.S. air transport command, began a drive in Hunan before which the Japanese retreated N., to concentrate at Hankow in Hupeh prov.

Hunchback or **Humpback**. Deformity due to curvature of the spine, which in severe cases causes an angular mass to project from the back. The condition is nearly always due to tuberculous disease of the vertebrae, or to injury in early life. When the bony structure has been actually destroyed, the most that can be hoped for is arrest of the disease. Milder forms of hunchback sometimes result from rickets.

Of historic hunchbacks one of the more notable was Richard III of England, called Richard Crookback. Andrea Solari, 1458-1516, the Italian painter, was called Il Gobbo, i.e. the hunchback.

Hundred. Name given to a division of most of the English counties. Its origin is doubtful, one theory being that it was the area upon which, in Anglo-Saxon times, a hundred warriors lived, and another that it contained 100 hides. Hundreds varied much in size, and are first mentioned in England in the time of Edgar, though undoubtedly in existence before then. The hundred had its own court and sent representatives to that of the shire. It had a hundredman, and the inhabitants were responsible collectively for the maintenance of the peace, courts being held frequently. They were composed of representatives from the townships in the hundred.

Twice a year a full or special court was held, the sheriff attending on these occasions to try criminals. Gradually most of the hundred courts fell under the control of the lords of the manor, and from about the 16th century ceased to have much importance. Until 1886 the hundred was liable for damage to property caused by rioters, but its interest now is solely historical. In Yorkshire, Lincolnshire, and other parts of England where Danes settled, the hundreds are called wapentakes; in Northumberland and Cumberland they are wards.

Hundred Days, **THE**. Name given to the period between Napoleon's return from Elba and his de-

feat and surrender after Waterloo. On March 1, 1815, he landed at Cannes and on the 20th he entered Paris. The hundred days are counted from then until June 28, when Louis XVIII returned to Paris. See France: History; Napoleon.

Hundred Years' War. Struggle between England and France that lasted from 1338 to 1453. It began with the claim of Edward III to the crown of France, although there were other causes of quarrel between the two nations. The English kings were still rulers of Gascony and Guienne, in itself a source of discord, while France had assisted Scotland against her ancient foe, and both sovereigns were busy seeking alliances in the Netherlands. Edward opened the contest by crossing to France with armies in 1338-39. In 1340 he won the battle of Sluys, and then for a few years he fomented civil war in Brittany.

In 1346 the English king invaded France again, won his great victory at Crecy, and took Calais. His armies in the south won successes equally useful, and then followed a truce. Soon renewed, the war had as its chief incidents the English capture of Guienne, and, in 1355, an attempt at peace. In 1356 another English invasion culminated in the victory at Poitiers, while half France was ravaged at this time. In 1360, when the English were actually besieging Paris, the first period of the war was ended by the treaty of Bretigny (*q.v.*).

In 1369 the war broke out again. As ruler of Aquitaine, the Black Prince had made himself hated, and his vassals appealed to the king of France. John of Gaunt went over with an army and ravaged France as before, and the Black Prince stormed and destroyed Limoges. The French won back a good deal of their land, while, in 1372, they crippled an English fleet in La Rochelle.

In 1377, almost in the week of Edward's death, the truce ran out. The French landed in Sussex, while the English were again beaten in France. Under John of Gaunt a great force was sent across. Brest and Cherbourg were given up to England by arrangement with their owners, Charles, king of Navarre, and the duke of Brittany, but the English were repulsed before St. Malo. In 1390 a truce for five years was made. In 1396 a peace was concluded, the English possessions being reduced to Calais and a district in the south from Bordeaux to Bayonne.

The dethronement of Richard II in 1399 was the starting point of fresh trouble. He was the son-in-law of the French king Charles VI, and in 1400 there was some talk of war. It was deferred, however, until 1403, when the French, without warning, sent out a fleet which sacked Plymouth, and an army that invaded Guienne. In 1410, Henry IV in reply formally allied himself with the duke of Burgundy and sent over an army which helped to relieve Paris from the rival faction, that of the Orleanist princes. The Orleanists then bought the support of Henry by very liberal promises, and an English force went to their assistance. On Sept. 25, 1413, a truce was made.

The Success of Henry V

Coming to the throne in 1413, Henry V prepared to attack France in earnest. He revived the claims of Edward III; these refused, he landed with his army in France in 1415, captured Harfleur, won the victory of Agincourt, and seized many Norman towns. In 1417 he invaded France again, this time capturing Caen and Rouen. The extent of his successes, which, however, were greatly helped by the internal condition of France, was seen by the terms of the treaty of Troyes, signed in May, 1420. By this Henry was recognized as the heir to the throne of France, meanwhile acting as regent for the mad Charles VI.

Many Frenchmen refused to submit to this humiliation, and a party under the dauphin, afterwards Charles VII, prepared to press his claims against those of Henry. The English king, however, continued his victorious career, entering Paris in May, 1422, but in the same year he died.

Under the direction of Bedford the English armies continued the conquest of the country. Victories were won at Crevant and Verneuil and at last Orleans was invested. In 1429 Joan of Arc appeared. Quickly the English were driven from Orleans and defeated at Patay, while Charles was crowned at Reims. The capture and death of the maid did not arrest the flow of French success, and in 1435 the duke of Burgundy, hitherto on the side of England, joined forces, by the treaty of Arras, with the French. In 1436 Paris was regained by the French, and in a short time the English had only Normandy and Guienne left to them. In 1450, after the battle of Formigny and the capture of Cherbourg, the duchy of Normandy was lost to England. In July,

1453, the defeat of Talbot at Castillon was another blow, and the capture of Bordeaux in Oct., 1453, which sealed the loss of Guienne, may be said to mark the end of the struggle. The English had lost all their possessions in France save Calais. See England; France; Joan of Arc.

Hungarian Dances. Among the dances native to Hungary the principal are the *csárdás*, the *kör-láncz* (society dance), and the *kanász-láncz* (swineherds' dance, performed only by the lower classes). The *csárdás*, most popular and best known outside Hungary, consists of two movements, both in common time: the first, called the *lassú*, slow and majestic, and the second, the *friss*, a lively

quickstep. These movements alternate at the desire of the dancers. Characteristics of the Hungarian, or Magyar, dance tunes are syncopated rhythm called *alla zoppa* (in a limping manner), and the liberal use of embellishments. Arrangements of Hungarian dances were published by Brahms, Dohnanyi (Ruralia Hungarica), and Bartók.

Hungarian Rhapsodies. Set of 14 pieces for the pianoforte by Franz Liszt, published 1853-54, and later orchestrated by the composer. They are free fantasias on Hungarian melodies, short transcriptions of tunes played by the gipsy bands of Hungary, most of which occur in his *Méodies Hongroises* published between 1839 and 1847.

senting the Magyar prelates, magnates, and inferior nobles; the mass of the people being in effect serfs. His reforms included the division of the country into self-governing counties. He was succeeded by his grand-nephew, Peter, who started the country on a long period of internecine strife.

Though, under Stephen, a constitution had been established, Hungary had, in effect, been governed wholly by its kings. In 1205 Andreas II became king. A weak man, he alienated his nobles, who at length compelled him to recognize and reform the constitution in the Golden Bull or great charter of 1222. In accordance with this the Hungarian parliament had to be assembled once a year, and the king, for the first time, had to take an oath to observe the constitution. The successor to Andreas II, in 1235, was Bela IV, in whose reign fresh hordes from Asia overran Europe, and Hungary suffered severely.

Bela's immediate successors call for no mention, and with Andreas III (d. 1301) the Arpad dynasty came to an end. Though descendants of Arpad had ruled so long, the monarchy was elective and, after two undistinguished kings, Charles Robert of Anjou was elected, and reigned from 1308-42. He did much to promote the arts, commerce, and manufactures of the kingdom. His son, Louis I, the Great, who reigned from 1342-82, was one of the most powerful rulers in Hungary's history; he confirmed the Golden Bull in 1351, and gave to the serfs freedom of movement—the first step towards emancipation and a step which Hungary was the first country in Europe to take. Louis the Great was succeeded (1382-95) by his daughter Mary—King Mary, for only by her keeping the title of king have the Hungarians allowed a woman to wear the crown of S. Stephen. For three-quarters of a century after the death of Louis, Hungary's state was one of anarchy, bloodshed, and disunion, consequent upon misgovernment.

National Hero of the 15th Century

In the first half of the 15th century Janos Corvinus Hunyadi rose to greatness as a military leader against the Ottoman invasions, but at the battle of Varna, 1444, the Hungarians suffered a severe defeat, and their king, Wladyslaw I, was killed. Hunyadi became regent during the minority of the weak Ladislas V, and continued to be the champion of Christendom against the Turks

HUNGARY: THE LAND AND ITS HISTORY

Walter Jerrold and Henry Baerlein

This article is supplemented by those on the towns of Hungary. For later history see the Novissima Verba section at the end of this work. See also Austria-Hungary; Hapsburg; also the lives of Francis Joseph, Korthy, Maria Theresa, and other rulers

From 1867 to 1918 Hungary formed part of the Austro-Hungarian Empire. It then had an area of 126,000 sq. m. and consisted of a great and a minor plain astride the Danube (Duna) river with a mountain bastion, the Carpathians, on the N. and E.; a series of Alpine foothills on the W.; an Adriatic coast-line and a Karst mountain system on the S.W.; and a river frontier on the S.E. By the treaty of Trianon, 1920, Hungary was reduced almost precisely to the great plain, the Alföld; only on the W. did it extend over the Bakony Forest towards the edge of the foothills, the elevation nowhere exceeding 2,000 ft., and about nine-tenths of the area was below 600 ft. The N. mts. were given to Czecho-Slovakia, the E. plateau and mts. to Rumania, the W. foothills to Austria, and the S.W. prov. of Croatia-Slavonia, which was never a part of Hungary proper, to Yugoslavia.

The great N.-S. stretch of the river Danube on which Budapest stands almost bisects the country. The Tisza (Theiss) enters N.E. Hungary near its exit from the Carpathian valleys, curves to its great bend at Csap on the frontier, and leaves Hungary just S. of Szeged. The lower courses of the threefold Körös are in Hungary, as is the greater portion of the Győr river. The Drave forms part of the frontier with Yugoslavia. Lake Balaton, 50 m. long, 2-7 m. broad, and the largest lake in central Europe, lies in W. Hungary.

The area of Hungary is 35,785 sq. m., and the pop. 9,319,992, of whom 92.8 p.c. are Magyar-speaking. Budapest (pop. est. 1,026,883) is the capital. The largest religious groups are R.C. (65.7 p.c.); Helvetian Evangelicals (20.8 p.c.); Augsburg Evangelicals (6 p.c.).

Hungarian rlys. (total length 5,428 m., of which 4,933 m. belong to the state) radiate from Budapest. Only 636 m. are double track.

HISTORY. That part of the ancient Pannonia which was to become known as Hungary may be said to have begun as a separate state with the arrival of the Magyars under Arpad in the 9th century A.D., although its name seems to derive from the earlier Hun immigrants into central Europe. In the 5th century it had been occupied by the Huns under Rugilas, uncle of Attila; in the 6th it was overrun by the Avars, and then c. 890 by the Magyars. The connexion of the Magyars with the earlier conquerors is indefinite.

The descendants of Arpad bore the title of duke until Stephen (977-1038), the son of Duke Geysa, assumed the title of king. Stephen's mother was a Christian, and he was at great pains to force the new religion on his people. He was recognized as monarch by the pope and granted the title of Apostolic King, borne by the rulers of Hungary until it became a republic. Stephen, canonised in 1083, made of the old loose military republic of Hungary a constitutional kingdom, with three diets or assemblies repre-

until his death at Belgrade in 1456. After the death of Ladislas V, 1457, Matthias Corvinus, son of Janos Hunyadi, was elected king, 1458. He is one of those rulers who live in legend as well as in history. The chief blot upon his fame is the leading part which he played in the Hussite Wars. Thus the hero of Hungary became the hated of Bohemia, and when both kingdoms came under the Austrian crown, the bitter feeling then engendered had its share in making unification impossible.

The Peasants' Revolt

After the death of Matthias in 1490, there followed rulers distinguished only for their weakness. In 1514 there was the Peasants' Revolt—put down with pitiless rigour—and on Aug. 29, 1526, the Turks, at Mohacs, inflicted a crushing defeat on the Hungarians. The youthful Louis II lost his life; two-thirds of the kingdom passed under Turkish dominion, and the beginnings were made of that Hapsburg domination which was to extend from Ferdinand I (1526-64) to the 20th century. At first things went smoothly in the severed kingdom, of which Austria ruled the W. part, and Turkey the centre and capital, while the Magyars were left only Transylvania. This division lasted for about 150 years. Under Rudolph II, who ruled from 1576 to 1608,

came an attempt to reduce Hungary to an Austrian province. A rebellion was headed by Stephen Bocskay, a noble who gained the title of prince of Transylvania, and regained the full privileges of the Hungarian nobles and toleration for the adherents to Protestantism. Bocskay was succeeded by Gabriel Bethlen, who won for Transylvania independence from the Hapsburgs.

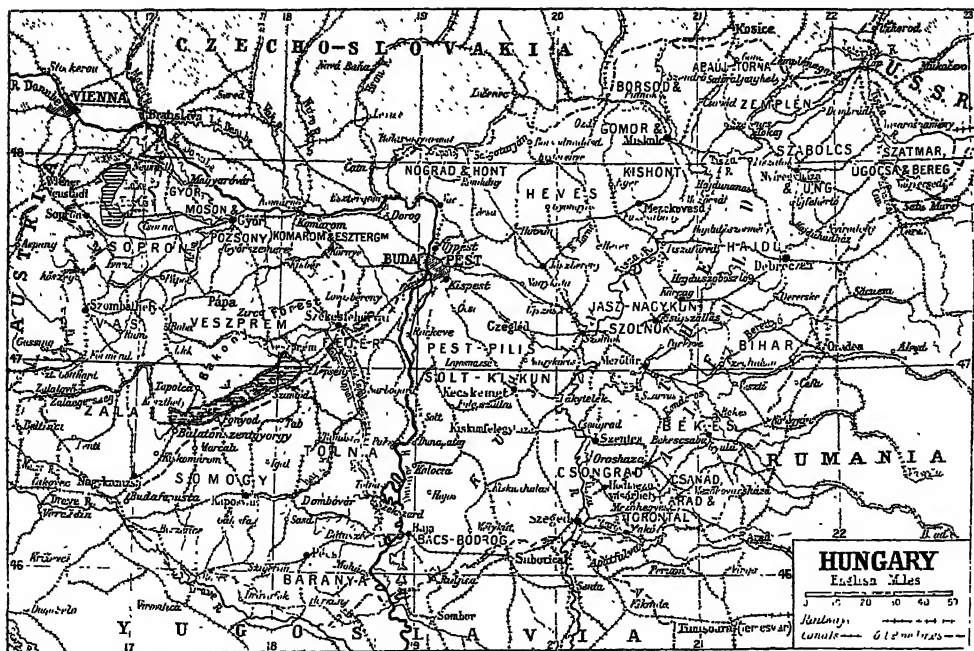

For half a century Transylvania served to safeguard Magyar liberty against the repressive tyranny of its Austrian rulers until the weak rule of George Rakoczi II, from 1646 to 1660, reduced it to the position of a Turkish dependency. After the Hungarians had made a bold bid in 1670 to throw off the Hapsburg yoke of Leopold I, they were subjected to a reign of terror, and in 1673 Leopold abolished the constitution. A rebellion, under Count Stephan Tököly, 1678, led indirectly to the strengthening of the Austrian hold, and the driving of the Turks from Buda and central Hungary. Further fighting went on until Austria and Turkey made peace at Karlowitz in 1699. Fighting was renewed again a few years later when a further treaty, 1718, left Austria in possession of the kingdom.

Meanwhile, the peasants, under Charles Rakoczi, had risen in revolt against their Hapsburg oppressors, and after varying fortunes

won in 1711 from Charles VI (Charles III of Hungary) an important agreement between Hungary and Austria. Hungarian independence was further affirmed by the same ruler in the Pragmatic Sanction of 1723. A period of reform followed, and under Maria Theresa considerable advance was made. Under her son Joseph II, who reigned 1780-90, renewed attempts at Germanising the country led to further strengthening of the national spirit, though a few years later Napoleon, seeking to alienate Hungary from Austria, found it impossible to do so; and for 20 years Hungary took no thought for her own internal condition in her anxiety to save those rulers who were her bane.

Régime of Metternich

Her only reward was the repression and oppression which marked the long Metternich régime up to 1848. Francis I, secured by Napoleon's downfall at Waterloo, refused to fulfil promises made to his Hungarian subjects, or even to summon the diet until his needs in 1825 made it essential. Hungary then granted the men and money asked for. A seemingly small matter at that diet was to have lasting significance. Szechenyi, one of the greatest revivers of the national spirit, addressed the diet in Magyar, instead of in Latin, which had continued the official

Hungary. Map of the European republic, showing the boundaries as settled by the peace treaty of Sept., 1947

language since 1001. A few years later it was claimed that Magyar should supplant Latin in all official documents and courts of law.

Shortly after Szechenyi's innovation, Lajos Kossuth (*q.v.*) began to distribute reports of the diet's proceedings, and was imprisoned. Another noble, who made a speech demanding that peasants and nobles should be equal before the law, was sentenced to three years' imprisonment in 1839. In 1835 Francis I had been succeeded by Ferdinand I, whose mental weakness left Metternich in almost absolute power. The rapidly growing national spirit found a great leader in Kossuth, who, released in 1840, rapidly won popularity. When the Paris revolution of 1848 broke out, Hungary and Austria responded. Metternich fled, and the emperor sought to play off Croats and Serbs against the Hungarians, and so precipitated the declaration of Hungarian independence, April 14, 1849.

Downtall of Kossuth

Francis Joseph, who had succeeded in Dec., 1848, called upon Russia for help, and, after sanguinary fighting, the provisional government resigned their power into the hands of their military leader, Görgei, as dictator. Görgei promptly surrendered his army to the Russians, and Kossuth and his colleagues went into exile. All the promises made on surrender were infamously ignored, and Hungary was more oppressed than ever. After Austria had been defeated by the Prussians at Königgrätz, 1866, Ferencz Deák regained autonomous independence for Hungary, 1867. The Austrian emperor continued to be king of Hungary; while foreign and naval and military affairs were controlled by joint ministries. The history of this so-called dual monarchy is given under Austria-Hungary.

During the First Great War the fortunes of Hungary were bound up with those of Austria. The common defeat brought common disaster to both, and on Oct. 31, 1918, a revolution broke out in Hungary, and an independent republic known as the Hungarian People's Republic was proclaimed on Nov. 16, with Count Karolyi as provisional president. A provisional national council took the place of the two houses of legislature. Despite an armistice entered into with the French general in command of the Allied troops of occupation, Rumanian and Serbian troops invaded Hungarian territory, and Czech forces occupied

Slovakia and the Danube district. Thus Hungary lost the Banat, and the coal-mining region of the north.

The Karolyi government was succeeded, March, 1919, by a Soviet government led by Bela Kun; but this fell at the end of July.

A rival government set up at Arad and Szeged brought about a *coup d'état* on Aug. 7 which resulted in the appointment of the archduke Joseph as governor of state, and of Stefan Friedrich as premier. The Supreme Council in Paris, however, refused to recognize the archduke's appointment, and a repressive government of reactionaries was formed.

Hungary remained nominally a kingdom with a vacant throne, the assembly elected by universal suffrage in Jan. and Feb., 1920, choosing Admiral Horthy as regent. On June 4 a peace treaty between Hungary and the Allies, settling the frontier and other outstanding questions, was signed at the Grand Trianon, Versailles. Charles, the ex-king, who abdicated in Nov., 1918, twice attempted to regain the throne of Hungary before he died in 1922.

Walter Jerrold

Horthy remained in power for nearly a quarter of a century. In the early years of his regime he did much to improve Hungary's economic position, and carried out minor measures of land reform and redistribution. A Nazi party of some strength, which adopted the symbol of the Arrow Cross, arose in the 1930s, but Horthy kept it under control and eventually disbanded it in Feb., 1939, in spite of his close association with Germany, Hungary's best customer.

Vienna Awards

Following frontier disturbances in 1938, Hungary received part of Slovakia and Ruthenia under the first Vienna award of Nov.; and when Czecho-Slovakia was completely dismembered in March, 1939, Hungary occupied the rest of Ruthenia. A second Vienna award, Aug., 1940, gave her at Rumania's expense a large part of Transylvania. She adhered to the Rome-Berlin axis (Dec., 1938), and to the anti-comintern pact (Feb., 1939), but when the Second Great War broke out maintained neutrality until June, 1941, when she declared war on Russia. She received in return great stretches of Czecho-Slovakia. In Dec. she was forced by a British ultimatum into declaring war also on Great Britain and the U.S.A.

The demands made on Hungary for troops by both Germany and Italy increased, and even her great territorial gains failed to reconcile her people to the bitter losses suffered by her forces on the eastern front. Horthy, badgered by the Germans, continued to refuse to furnish in full the troops and supplies demanded, until, returning in March, 1944, from a visit to Hitler at Berchtesgaden, he found Budapest occupied by German troops. The Russians entered Transylvania in Aug., and crossed the frontier into Hungary proper at the beginning of Oct. Horthy asked for an armistice, but, deposed by the resurgent Arrow Cross, fled to Germany. The Hungarian *c.-in-c.* went over to the Russians, and a provisional government in Russian-occupied Hungary declared war on Germany in December. By Christmas the Russians had surrounded Budapest and in the early part of April, 1945, they drove the last Germans out of Hungary. An armistice was signed in Moscow in Jan., 1945, between Hungary and the Allies. (See Russo-German Campaigns.)

Republic Established

One of the first acts of the provisional government was to abolish in March the ancient feudal system of land tenure under which in 1938, despite Horthy's reforms, 36 magnates had owned more than a million acres while 1,200,000 peasants owned only 950,000 acres. General elections held in Nov. under a new law providing universal, secret, and equal suffrage for men and women, gave the Smallholders 245 seats, the Communists 70, the Socialists 69, other parties 25. The new assembly abolished the monarchy and set up a republic in Feb., 1946. But the decisive electoral victory of the Smallholders did not bring political peace. Conforming with the wishes of the Allies, their leader formed a coalition government. In this the Communists, who held the ministry of the interior and other key posts, continually manoeuvred for greater power until in the winter of 1946-47 they effected the arrest of some 300 army officers and members of the Smallholders' party, alleging that they were guilty of conspiracy against the state.

The arrest on Feb. 25 of Bela Kovacs, secretary-general of the Smallholders, by the Russians on a charge of acting against the Soviet occupation forces as well as of participation in the alleged

conspiracy, gave a new turn to the situation. Several of those arrested earlier were brought to trial at the end of Feb., and after a seven weeks' hearing were sentenced, three to death, others to terms of imprisonment. British and U.S. notes asking that a tripartite inquiry should be held into the arrest of Kovacs were rejected by the Russians, and late in May the prime minister, Ferencz Nagy, then on holiday in Switzerland, refused to return to Hungary. A new government was formed, and a new electoral law passed in anticipation of a new election in the autumn.

In the meantime the peace treaty between Hungary and the Allies, under which Hungary renounced all her territorial acquisitions since Jan. 1, 1938, was drawn up in Paris and signed there on Feb. 10, 1947. Ratified by the Hungarian national assembly, in June and by the Allies in Sept., it became effective from midnight of Sept. 15-16, 1947. See N.V.

Bibliography. A Short History of the Hungarian People, F. Eckhart, 1931; Hungarian Minorities in the Succession States, Sir R. Gower, 1937; History of Hungary, Otto Zarek, 1939; A History of Hungary's Minorities, E. Flachbert, 1944.

LANGUAGE AND LITERATURE. Hungarian is an agglutinative language having no basic relation to the languages of neighbouring countries, and related to the Finnish. It is now generally acknowledged as one of the Ugrian languages, though some scholars, such as Arminius Vambéry, say that it derives originally from Turkish, with Ugrian elements added. It is, however, more probable that the original stock was Ugrian, and that the Turkish elements were added during long association with the Turkish people as neighbours and conquerors. The literature of Hungary was late in developing. The first Hungarian book, *Budai Krónika*, was printed in 1473, but more than three centuries elapsed before the native literature became anything more than second rate.

Nicholas Zrinyi, 1618-84, wrote a national epic, *The Siege of Szigetvár*, on classic and Italian models; Stephen Gyöngyösi, 1625-1704, was author of a baroque Ovidian epic, *The Venus of Murány*, and of other poems. In the 18th century war for freedom arose the popular Kurucz poetry, lyric patriotism expressed in the army of Rákóczy, while one

of that leader's lieutenants, Count Kelemen Mikes, 1690-1762, wrote much in an attractive style, his most notable work being the published *Letters from Turkey*.

The writer to whom the literary awakening was most notably due was George Bessenyei, 1747-1811, who became a strong Voltairean, wrote plays, stories, etc., and advocated the founding of a national theatre and an academy. Contemporary with him were József Gvadányi, 1725-1801, writer of markedly original national narrative verse, and Benedikt Virág, 1752-1830, known as the Hungarian Horace, historian and writer of odes on classic lines. Early in the 19th century began a momentous movement for the reform and enrichment of the Hungarian language. The initiator was Ferencz Kazinczy, 1759-1831, a didactic poet and prose writer.

It was more particularly in poetry that the reawakening Hungarian spirit found expression; only some of the most representative can be cited. Alexander Kisfaludy, 1772-1844, was the first great romantic poet. His brother, Charles Kisfaludy, 1788-1830, one of the creators of the Hungarian drama, was also a writer in lyric verse and novels of country life. His ode on Mohács Field has taken its place as a Hungarian classic. Ferencz Kölcsey, 1790-1828, was a passionately national poet. József Katona, 1790-1830, shared with Charles Kisfaludy in the founding of a national drama.

Michael Vörösmarty, 1800-55, one of the amplifiers of the language and master of a rich lyric style, gained the popular title of the Hungarian Poet-King. Gregory Czuczor, 1800-66, wrote fine epics of old national life, and edited the great Hungarian dictionary which helped to stabilise the literary language. Lajos Kossuth, 1802-94, the patriot leader, though primarily an orator, was also a most impressive writer of prose.

Writers of Drama and Fiction

Alexander Petöfi, 1822-49, won recognition as the greatest lyric poet that his country had produced. Later writers of outstanding merit include Gregory Csiky, 1842-91, a satiric dramatist of considerable power; and Edward Tóth, 1844-76, also a dramatist, and Eugene Péterfy, 1849-99, the chief of Magyar essayists. In fiction the more pronounced success came somewhat later. Andrew Fáy, 1784-1861, was a fabulist who wrote in *The Béltéky Family* a social novel expressive of the spirit

of progress of the early 19th century. Nicholas Jásika, 1794-1865, has been dubbed the Walter Scott of Hungary. József Eötvös, 1813-71, was another great novelist of the period, in whose work, it has been said, the Hungarians were revealed to themselves.

Sigismund Kemény, 1814-77, is described by some of his compatriot critics as the greatest of all Magyar novelists: Nearly as great and of world-wide popularity is Maurus Jokai, 1825-1904, whose novels ran into hundreds.

Walter Jerrold

Hungchen. Town and former treaty port in the N.E. provinces of China. It is on an affluent of the Tumen river, 200 m. S.W. of Vladivostok. A small mud-walled town, it dates from 1714, and was opened to foreign trade, 1915. Pop. 8,500.

Hunger. Generally an appetite for food determined by habit. It may arise from the altered pressures of an empty stomach, or be due to a craving for nourishment on the part of the tissues. Abnormal hunger for food is often associated with such conditions as diabetes. Appetite for abnormal foods, Pica, is characteristic of certain conditions, e.g. hysteria. A dislike of favourite foods and a longing for certain possibly unusual articles of diet is often an early symptom of pregnancy.

Air hunger describes a condition of breathlessness seen in the coma of diabetes; in heart failure, when circulation of the blood is poor, and in severe anaemia where there is insufficient haemoglobin to act as a carrier of oxygen to the tissues. Air hunger is also experienced at varying heights round about 20,000 ft. owing to the diminished volume of the blood gases, which can no longer carry out their work of gaseous exchange with the tissues.

Hungerford. Market town and parish of Berkshire, England. On the Kennet, 26 m. W. of Reading, it is served by railway and by the Kennet and Avon canal. A hunting and angling centre, it is noted for its trout fishing. There is a town hall, and in the Bear Inn William of Orange in 1688 met the commissioners sent by James II. The chief industry is an agricultural trade. The town is known for its annual festival, celebrated at Hocktide (q.v.). This commemorates the gift to the townsfolk by John of Gaunt of the manorial rights. Near are Inkpen Beacon, and Littlecote, one of the finest manor houses in the country. Pop. 2,870.

Hungerford Market. An old London market. Built originally in 1669 and enlarged in 1831-33, it was pulled down in 1862 to make room for the Charing Cross terminus of the Southern rly. It took its name from Sir Edward Hungerford (1632-1711), who, when his house was burnt, 1669, secured the right to erect a market in its grounds as a means of repairing his broken fortune.

Hungerford Market, London, on the opening day, July 2, 1833. The occasion was celebrated by a balloon ascent, seen on the right

From a contemporary drawing

The existing Hungerford Bridge, built 1860-64, is partly supported upon the piers of the old Hungerford suspension bridge, made for foot passengers only, the chains of which were used for the bridge across the Avon at Clifton, near Bristol. It was hit by a flying bomb in 1944 as a result of which the footbridge was closed for a time; rly. traffic was not suspended.

Hunger Strike. Refusal by a prisoner to take food. This occurs usually either as a protest against the legality of the sentence or in the hope of inducing the authorities to remit it rather than acquiesce in the prisoner's voluntary death. This method of resistance to authority was resorted to by many of the militant suffragists during their campaign to secure votes for women. It was met by legislation, popularly known as the Cat and Mouse Act, under which prisoners were provisionally released but were liable to re-arrest as soon as their health was sufficiently restored for them to continue serving their sentence. During 1913 Mrs. Pankhurst and 182 other suffrage prisoners came under the effects of the Act.

The hunger strike was again resorted to in 1920 by a number of Sinn Feiners who refused to recognize the jurisdiction of British courts. After the death of Terence MacSwiney (*q.v.*) through hunger-

striking the method was generally acknowledged to have lost its efficacy.

Hunger strikes were frequently practised by Quakers, both men and women, during the persecution of the 17th century. Barbara Blaugdone fasted for six days and nights in the Bridewell at Marlborough, and on another occasion for 14 days and nights in Exeter gaol "as a witness against that

dark, professing people" who had persecuted her; and John Evelyn, in his diary under date July 8, 1656, mentions his visit to some Quakers in Ipswich gaol, one of whom was said to have fasted 20 days, while another perished on the tenth day of his fast.

The moral responsibility for the death of a hunger-striker

as a result of his voluntary starvation is a matter of debate. On two occasions the death of a Quaker in prison was claimed by his persecutors as the result of his "wilful rejecting of his natural food," but the verdict was repudiated by Fox and other Friends as a shameful accusation. On the other hand, during the controversy about the hunger strike of Terence MacSwiney several eminent R.C. priests declared their opinion that death by voluntary starvation was a form of self-murder.

Hunnebeds or **HÜNNEBETTEN**. Neolithic sepulchral chambers, each comprising a row of capstones, poised upon two or more upright slabs. Elongated dolmens, scattered from the Yssel Meer to the Oder, there are 54 in the Dutch prov. of Drenthe, formed of unhewn boulders brought from Scandinavia by glacier action. One at Borger has 10 capstones on 35 blocks, enclosing an oblong 70 ft. by 14 ft. Both ends are closed, and entrance is through the middle of the sunny side. *See* Barrow.

Huns. Name of a race of Asiatic origin which invaded Europe in the 4th century. The Mongolian, Turanian, or Tartar races of Central Asia periodically poured huge migratory hordes of nomadic warriors into Europe. One of these hordes bearing the name of Huns, a name which became a byword for

merciless savagery, crossed S. Russia, subjugating or wiping out the populations, and subduing amongst other tribes the Ostrogoths, at the end of the 4th century A.D. In the second quarter of the 5th century their khan was the mighty warrior Attila (*q.v.*), who towards the middle of the century swept with his devastating armies across central Europe, but was flung back at the battle of Châlons, 451. After his death the Huns broke up under their tribal chiefs, and probably were absorbed into the later hordes invading Europe.

The term Huns was applied to the German troops in the First Great War. It had its origin in an address by the kaiser to the soldiers he sent to join the Allied force in China for the relief of the Pekin Legations in 1901. After referring to himself as the modern counterpart of Attila, he exhorted his troops to "gain a reputation like that of the Huns under Attila." The ruthlessness of his troops in the First Great War confirmed the popular application of the term Huns (or sometimes collectively, the Hun) to the German soldiery. *See* Attila.

Hunsbury Camp. Late-Celtic settlement upon Hunsbury Hill, 2 m. S.W. of Northampton, England. Within an oval earthwork, 560 ft. by 445 ft., 300 refuse pits were excavated in 1880-86. The remains, mostly in the Nottingham museum, include 150 quernstones, 8 spindle-whorls, weaving combs, iron saws, animal bones, and charred corn. Two ornamented bronze sword-scabbards, spear-heads, bridle-bits, and a chariot wheel suggest a military element; fibulae, glass beads, scrolled pottery, and iron currency bars betoken a high degree of comfort.

Hunsrück. Mountain district of W. Germany. It is S. of Coblenz, lying between the Moselle and the Nahe rivers, and is linked with the Vosges. The highest summit is the Walderbeskopf (2,676 ft.).

Hunstanton. Watering place and urban dist. of Norfolk, England. It stands on the E. side of the Wash, 15 m. from King's Lynn, and has a rly. station. It consists of Old Hunstanton and New Hunstanton. In the former is the fine church of S. Mary, with interesting monuments, and the hall, a Tudor building, the residence of the Le Strange family who have lived here since the Norman conquest. New Hunstanton's attractions include a golf course and fine beaches. Pop. 2,700. *Pron.* Hunston.
